About Amsterdam

Amsterdam has an oceanic climate strongly influenced by its proximity to the North Sea to the west, with prevailing westerly winds. Both winters and summers are considered mild, although winters can get quite cold, while summers are quite warm occasionally. Amsterdam, as well as most of the North Holland province, lies in USDA Hardiness zone 8b. Frosts mainly occur during spells of easterly or northeasterly winds from the inner European continent. Even then, because Amsterdam is surrounded on three sides by large bodies of water, as well as having a significant heat-island effect, nights rarely fall below -5°C (23°F), while it could easily be -12°C (10°F) in Hilversum, 25 kilometres (16 miles) southeast.
