

# Antibiotic resistance: the bigger picture, a holistic viewpoint of outcomes and costs.

**Glenn S Tillotson PhD, FIDSA**  
**Senior Partner**  
**TranScrip Partners LLC**

# The end of medicine as we know it Jim\* !

“  
**A post-antibiotic era means, in effect, an end to modern medicine as we know it. Things as common as strep throat or a child’s scratched knee could once again kill.**  
”

Dr Margaret Chan,  
Director-General, World Health Organization. March 2012<sup>2</sup>

\* For you Trekkies ...Attributed to Gene Roddenberry 1975 app.

# Antimicrobial resistance.....

- Antibiotic resistance is a global issue and is increasing
- Multi-drug resistant bacteria cause life threatening infections
- Antibiotics **cure** life-threatening infections.
- Other treatments that are used to treat life threatening conditions can cost upwards of \$30,000 for a months course (e.g. the anticancer treatments Avastin, Folutyn).
- A course of Sovaldi to **cure** Hepatitis C costs **\$84,000** which is frequently justified by the need to maintain innovation in R&D.
- Impact of antibiotics is clear and undisputed yet.....
  
- **Holistic means “upholds that all aspects of people's needs including psychological, physical and social should be taken into account and seen as a whole”.**

# Recent US-based analysis: Societal values = holistic overview.

Eastern Research Group (ERG) tasked by US government to account for ALL costs involved in certain infections \*

- Comprehensive model for drugs for 6 key indications (ABOM, ABSSSI, CAP, cIAI, cUTI, HAP-VAP)<sup>1</sup>
- Current NPV of the new antibiotic is always **< \$40 million**
  - All 90% confidence intervals on estimate went below zero
- Value to the patient was MUCH higher
  - Just based on the value of days of work and life restored, the value to society ranged from \$500m to **\$12 billion**
- Thus, this new holistic evaluation shows
  - Starting antibacterial R&D is not financially rational, at least not with traditional R&D costs and approaches because.....
  - **We (Society) undervalue these drugs**

\* Sertkaya A, Eyraud J, Birkenbach A, Franz C, Ackerley N, Overton V, Eastern Research Group. Analytical framework for examining the value of antibacterial products. Report to US DHHS. [http://aspe.hhs.gov/sp/reports/2014/antibacterials/rpt\\_antibacterials.cfm](http://aspe.hhs.gov/sp/reports/2014/antibacterials/rpt_antibacterials.cfm)

**Table 1. Influences on studies assessing the impact of infection with antimicrobial-resistant bacteria.**

| Methodologic issue, factor                 | Aspects   |
|--|---|
| Outcome                                    |   |
| Mortality                                  | In hospital, attributable to infection; in hospital and after discharge, all-cause  |
| Morbidity                                  | Length of hospitalization, need for ICU care, need for surgery or other procedures, activity level at discharge, and loss of functional status (loss of work) |
| Economic                                   | Hospital costs, hospital charges, resource utilization, total health care costs, skilled nursing, and other outpatient costs                                  |
| Outcome perspective                        |   |
| Hospital                                   | Inpatient morbidity, mortality, and/or costs  |
| Third-party payer                          | Inpatient and outpatient health care costs  |
| Patient                                    | Decreased functional status, loss of work, and fewer antimicrobial agent options  |
| Societal                                   | Total health care costs of antimicrobial resistance and loss of antimicrobial classes   |
| Choice of reference group                  |   |
| Patients infected with susceptible strains | ...   |
| Uninfected patients                        | ...   |
| Patients colonized with resistant strains  | ...   |
| Confounding factors                        |   |
| Length of hospital stay                    | APACHE score, McCabe/Jackson score, and Charlson comorbidity score <sup>a</sup>   |
| Underlying severity of illness             | ...   |
| Comorbid conditions                        | ...   |

**NOTE.** ICU, intensive care unit. Adapted and reprinted with permission from Cosgrove and Carmeli [2].

<sup>a</sup> APACHE is a severity of disease classification system that uses a point score based on initial values of 12 routine physiologic measurements, age, and previous health status. It is a validated tool to predict mortality for patients in the ICU. The McCabe/Jackson score uses a simple 3-category score to predict mortality for patients with bacteremia due to gram-negative organisms. The Charlson comorbidity score is a simple, readily applicable, and valid method of estimating risk of death from comorbid disease.

## ReACT information on the impact of antibiotic resistance

| <b>Bacteria</b>                    | <b>Death rate<br/><i>resistant strain</i></b> | <b>Death rate<br/><i>sensitive strain</i></b> |
|------------------------------------|---|---|
| <i>E. coli</i> <sup>23</sup>       | 32%   | 17%   |
| <i>A. baumannii</i> <sup>25</sup>  | 16.4%   | 5.4%  |
| <i>A. baumannii</i> <sup>19</sup>  | 53.8%   | 31.0%*  |
| <i>K. pneumoniae</i> <sup>26</sup> | 42.9% (CRKP)                                  | 18.9%   |
| <i>K. pneumoniae</i> <sup>27</sup> | 43.8% (CRKP)                                  | 12.5%   |
| <i>K. pneumoniae</i> <sup>10</sup> | 38%   | 12%   |
| <i>S. aureus</i> <sup>28</sup>     | 36.4% (MRSA)                                  | 27.0%   |
| <i>S. aureus</i> <sup>14</sup>     | 23.6% (MRSA)                                  | 11.5%   |

**Table 2:** Comparison of death rates (mortality) in patients with resistant or sensitive strains of bacteria. \*=not fully sensitive.

# MRSA- costs and facts

- In USA costs >\$560 million to third party payers.
- Lost productivity amounts to \$>2.7 BILLION.
- Direct costs for CA MRSA are around 25% of total costs.

| Disease           | Est costs per case (\$) |
|-------------------|-------------------------|
| CA MRSA           | 7,070-20,489            |
| Influenza         | 3,000-4,000             |
| Foodborne illness | 1,851                   |
| Pertussis         | 1,952                   |
| Lyme disease      | 397-923                 |

# ESBL Infections Are Associated With Higher Mean Hospital Costs (US)

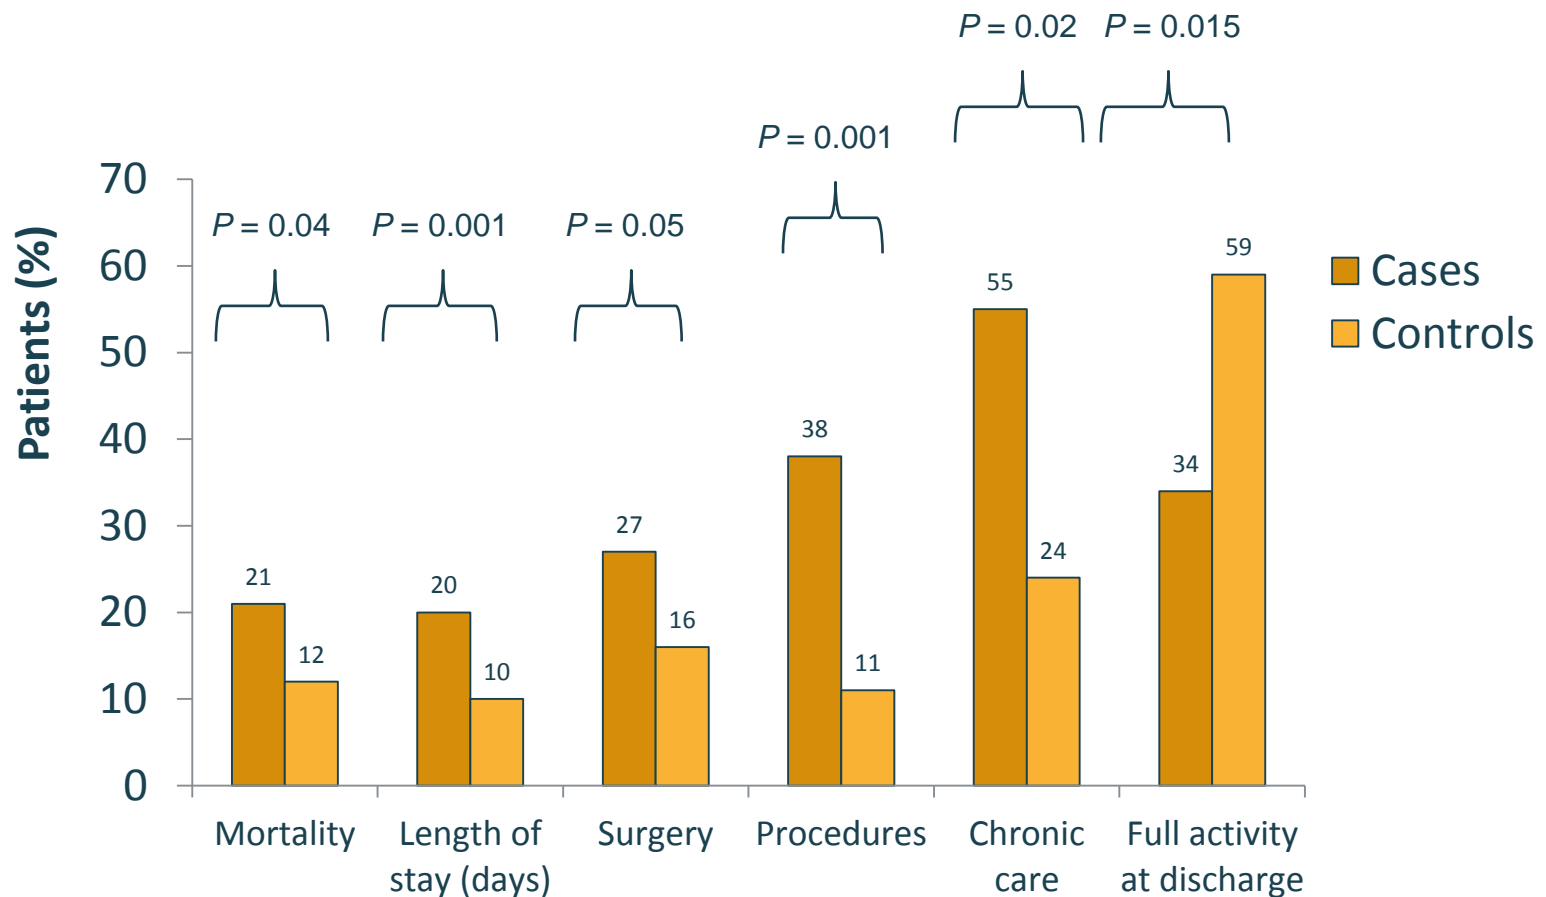

- Systematic literature review of 8 studies on the costs of ESBL-producing Enterobacteriaceae

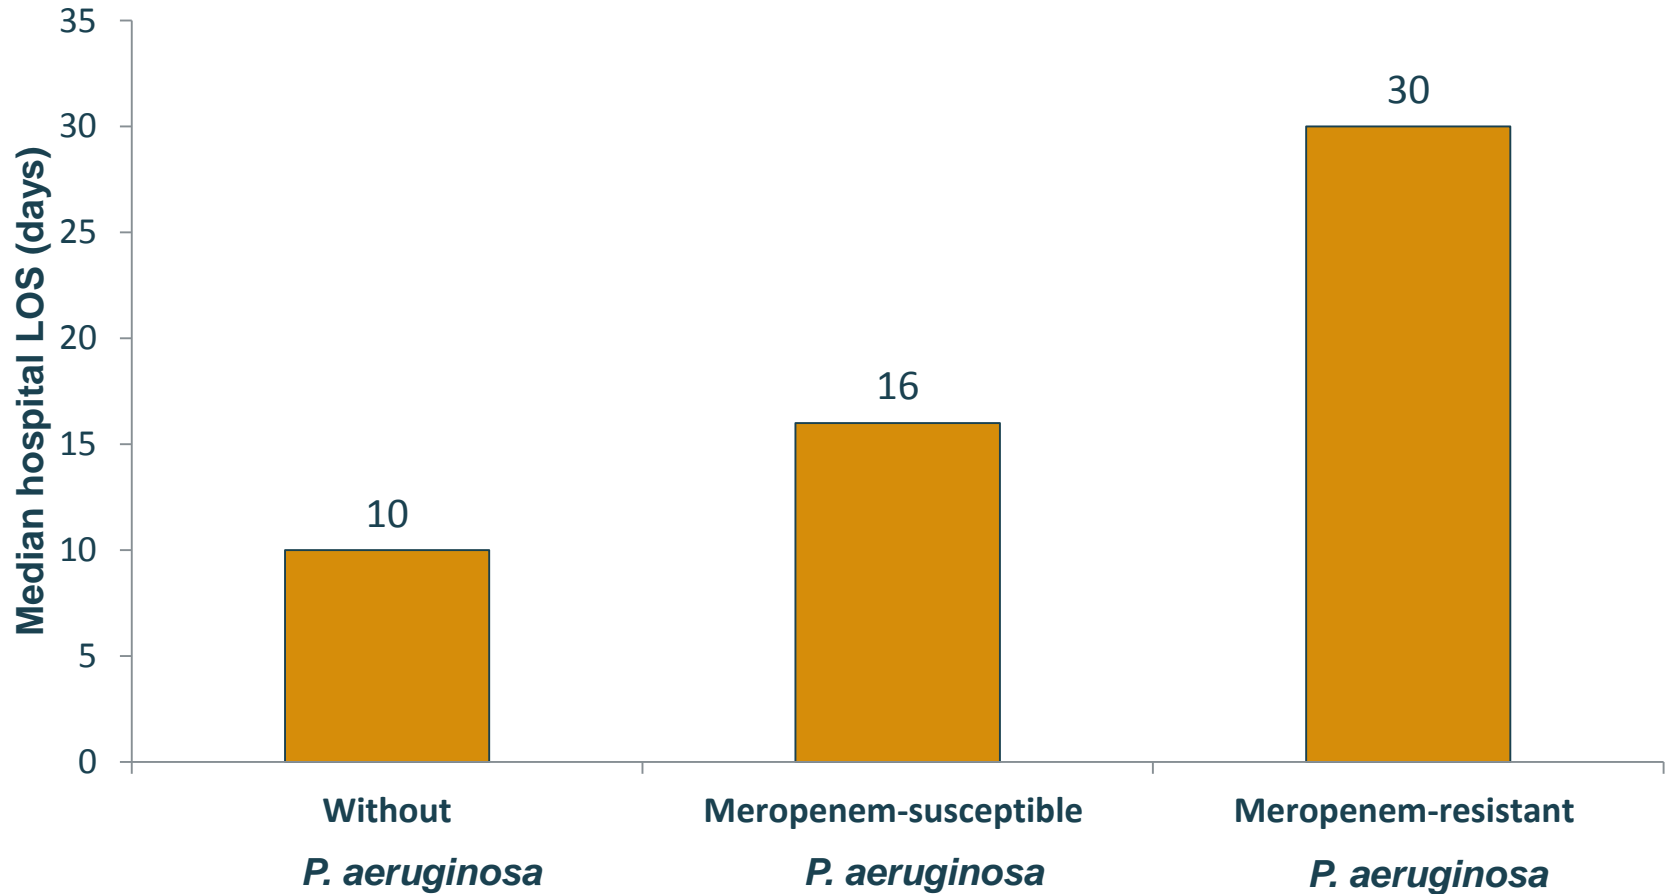

*P* value for difference in cost between ESBL+ vs ESBL- infections.

# Multidrug-resistant (MDR) *Pseudomonas aeruginosa* Is Associated With Increased Morbidity and Mortality

Retrospective study at Tel-Aviv Sourasky Medical Center, Israel; 82 patients with MDR *P. aeruginosa* and 82 controls. **More severe outcomes with MDR *P. aeruginosa*.**

# Length of Stay\* Increases With Drug Resistance

$P < 0.001$  for meropenem resistant *P. aeruginosa* vs other comparators.

LOS, length of stay.

Eagye et al. *Infect Control Hosp Epidemiol.* 2009;30:746-52. \* also drives increased costs to relatives.

# Impact of resistance on *Acinetobacter baumannii* (ACB) infections.

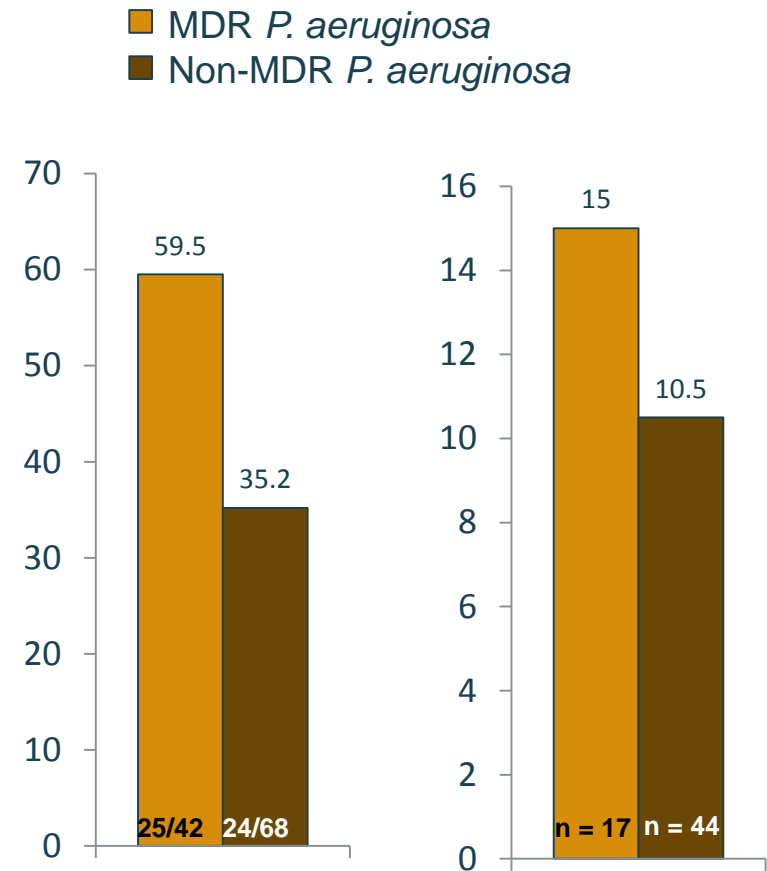

- Timeline: 2009-Q3/2013.
- Locations: 152 US hospitals
- Confirmed ACB infections.
- 376 MDR ACB in primary pneumonia
- 1,869 MDR ACB in primary sepsis.

| Parameter                      | Pneumonia |             | Sepsis  |             |
|--------------------------------|-----------|-------------|---------|-------------|
|                                | MDR ACB   | Non MDR ACB | MDR ACB | Non MDR ACB |
| Length of hospital stay (days) | 13.4      | 10.5        | 16.2    | 14.8        |
| ICU stay required %            | 46.6      | 22.6        | 62.8    | 46.8        |
| Mortality %                    | 15.3      | 5.9         | 21.7    | 16.9        |
| Hospital costs \$              | 32,086    | 24,367      | 43,997  | 38,494      |

LaPensee K et al IDWeek 2014 Abstract 338

# Clinical Outcomes of *P.aeruginosa* Pneumonia in ICU Patients

- **Retrospective analysis of 110 ICU patients with culture-confirmed *P. aeruginosa* pneumonia in Italy**
  - Approx. 80% isolates were drug resistant
    - 38% multidrug resistant (MDR)
  - Overall ICU mortality = 44.5%
  - MDR *P. aeruginosa* ICU mortality = 59.5%
- **In logistic regression, inadequate initial antibiotic therapy (IIAT), diabetes mellitus, elevated Simplified Acute Physiology Score II, and older age were independently associated with ICU mortality**
- **MDR in the *P. aeruginosa* isolate can significantly increase the need for mechanical ventilation**

# The value of new antibiotics is clear.

- **Obvious clinical need**
- **Global healthcare mandate for new drugs is vital**
- **Net Present Value is unambiguous**
- **MDR infections are clearly “bad news”**
  - More deaths, so the value of a life is obvious
  - Longer hospital or Unit stay
  - Lost productivity of patient and many family members
  - Efficacy of new antibiotics is undisputed
  - Impact of inappropriate or/and generic drugs is clear and not debated.

# Value of a Statistical Life (VSL)

- To calculate VSL, we first took the value of a statistical life reported in 2000 dollars by age group from Aldy & Viscusi (2008).
- Next, it was necessary to adjust the VSL values by age group to capture changes in real income as well as prices from 2000 to 2011.
- Current data from the U.S. Bureau of Economic Analysis (BEA) show that the real personal income per capita was \$28,888 in the year 2000 and \$32,635 in 2012 (both in 2005 dollars), yielding a growth rate of 13 percent over this span of time.
- Hammitt & Robinson (2011) report that U.S. regulatory agencies generally assume that a 1.0 percent change in real income over time will result in a 40 to 60 percent change in the VSL.
- Using the midpoint of this range (50 percent), we inflated the reported VSL values by age group by 1.065 ( $= 1 + [0.5 \times 0.13]$ ) to account for changes in real income from 2000 to 2011.
- To adjust the VSL values for price changes, we used the general consumer price index-based inflation calculator (available on the Bureau of Labor Statistics website) that shows an average price increase of approximately 31 percent over the same time period.
- We then calculated the age-specific VSLY and apply it to the estimated number of years of life lost for each condition

**Easy huh?**

# Antibacterials: the big mismatch 2014 !!

Industry returns for a new antibiotic per indication (Figures in \$ Millions)

| Indication       | Private Value (in \$ Million) |               |                 |

# The Bacterial Challenge in Europe: Time to React

- Estimates in 2007 show that together, third-generation cephalosporin-resistant *Escherichia coli*, third-generation cephalosporin-resistant *Klebsiella pneumoniae*, and carbapenem-resistant *Pseudomonas aeruginosa*, were responsible for:
  - 193,300 cases of infection
  - 18,200 excess deaths
  - 1,375,000 extra hospital days
    - With *P. aeruginosa* accounting for 141,900 infections, 10,200 deaths, and 809,000 extra hospital days
  - €503,100,000 extra in-hospital costs
  - €4,500,000 extra outpatient costs
  - €59,300,000 productivity losses due to absence from work
  - €300,300,000 productivity losses due to patients who died from their infection

*“It is likely that the human and economic burden caused by antibiotic resistant Gram-negative bacteria...represents a major challenge to appropriate therapy, prevention and control in the foreseeable future.”*

# So to the bigger picture

tranScrip

- So how do antibiotics compare in “value” with other therapeutics?
- Bearing in mind the usual number of MDR infections which have a significant impact on management costs and Societal dues.

# Comparison of Estimated number of Orphan Disease subjects/country

Orphan disease = A rare disease or disorder is defined in the U.S. as **one affecting fewer than 200,000 Americans.**

# Preserving antibiotics rationally.....

- **According to calculations a 1% reduction in the usefulness of existing antibiotics could impose costs of \$600billion to \$3trillion in lost human health!!**
- **WEF 2013- reported a negative impact of 0.4-1.6% on GDP by nation.**

On top of destabilizing our health systems, there are profound cost implications for economic systems and for the stability of social systems. The annual cost to the US health care system of antibiotic-resistant infections is already estimated at between US\$ 21 billion to US\$ 34 billion.<sup>11</sup> Elsewhere, losses to GDP have already been estimated at 0.4% to 1.6%.<sup>12</sup> The consequences of

# Justum pretium

- Justum pretium = just price or “fair value”
- By moral necessity “**price must reflect worth**”
- If a new antibiotic is more efficacious than current vs MDR pathogens then it should be priced to give “good or fair value”.
- The overall Societal costs of antibiotic resistance is **massive and unrecognized.**
- **Not suggesting all new antibiotics be “orphan priced” but.....**
- Current regulatory approaches could better reflect orphan methods to normalize the field.
- The “market” by MDR infection is too small to provide an adequate ROI..... **Thus our valuation and perception must shift if we are to encourage pharma to continue to develop new antibiotics..**

THERE IS ALWAYS SOMEONE...

... WHO WILL DO IT CHEAPER!
