PERFORMANCE

✓ Asphalt Binder

- Aggregates
- Mix Design
- Construction

Asphalt Aging:

Asphalt hardens and gets brittle and prone to cracking due to weathering and construction heating

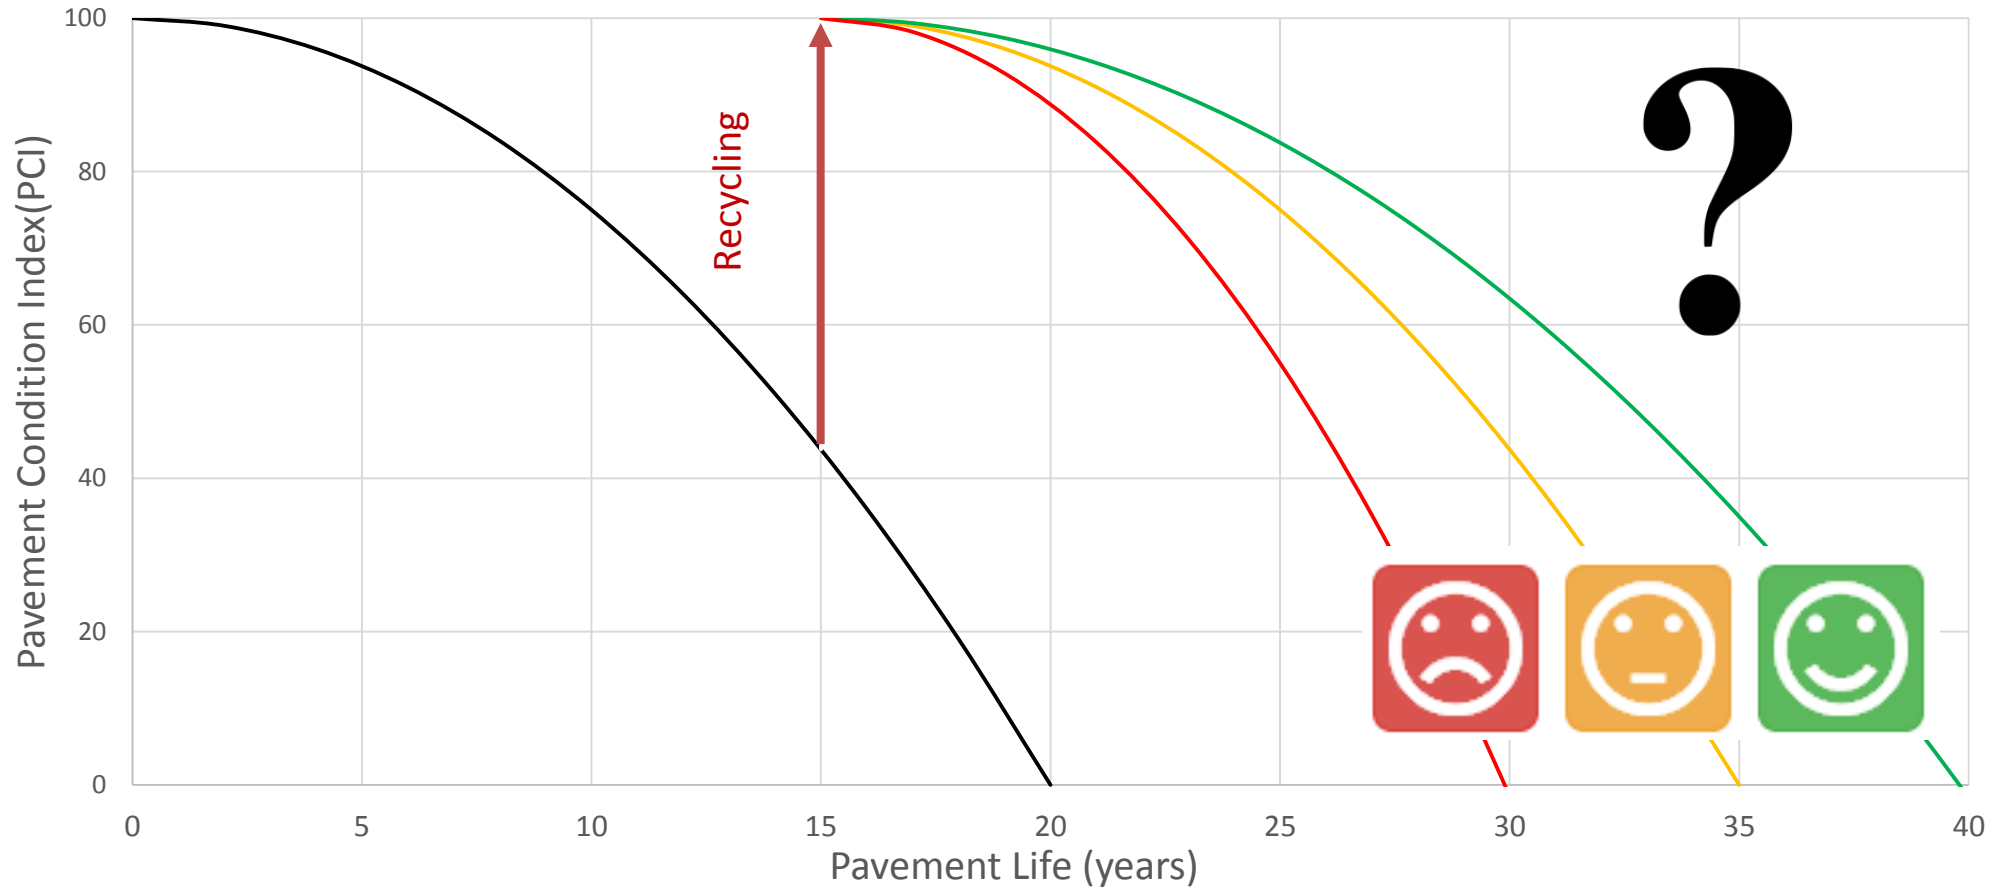

Rejuvenation:

Adding a recycling agent (rejuvenator) to aged asphalt to cure aging and restore its original properties

❖ Effective rejuvenation has a major role in successful recycling

Recycled Binder Durability

Introduction

Research Objectives

Methodology

Binder Tests

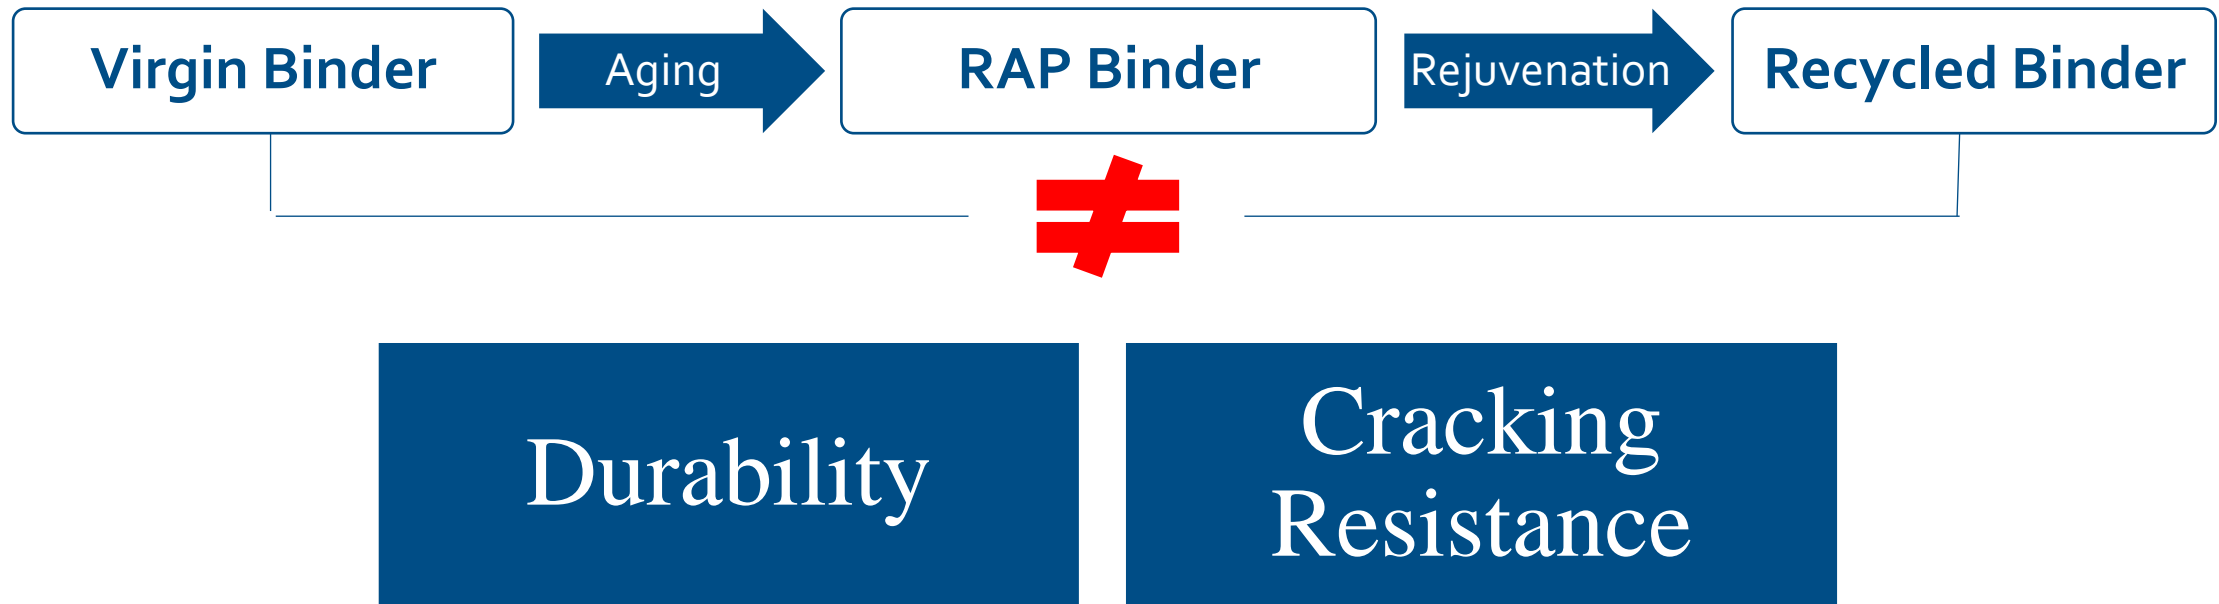

Mixtures Tests

Conclusions

How to verify effectiveness of rejuvenation?

➤ Current practice:

Viscosity or penetration or performance grade requirements
FDOT: Pen. : 40 – 80 dmm ; Viscosity @ 160 ° C : 5000 – 15000 Poises

Research Objectives:

Evaluate Cracking Resistance and Durability of 100% RAP mixtures

- ❖ Compare the cracking resistance of several samples of recycled binder and mixture to that of non-recycled samples
- ❖ Monitor changes in the cracking resistance over the life of the pavement
- ❖ Investigate the effect of rejuvenators on crackling resistance and durability

Methodology:

| | Cracking Resistance | Aging |
|---------|------------------------------|-----------------------------------------------|
| Binder | Bending Beam Rheometer (BBR) | Pressure Aging Vessel (PAV) |
| Mixture | Texas Overlay Test | Accelerated Pavement Weathering System (APWS) |

Introduction

Research Objectives

Methodology

Binder Tests

Mixtures Tests

Conclusions

Bending Beam Rheometer (BBR)

Bending Beam Rheometer (BBR)

Parameters

Creep Stiffness
(S)

- The stiffness at 60 second
- Indicate the amount of thermal stresses
- PG requirement: $S \leq 300$ Mpa

stress relaxation
parameter
(m-value)

- The slope of master stiffness curve at 60 s
- Indicates the ability to relax stresses
- PG requirement: m-value ≥ 3.00

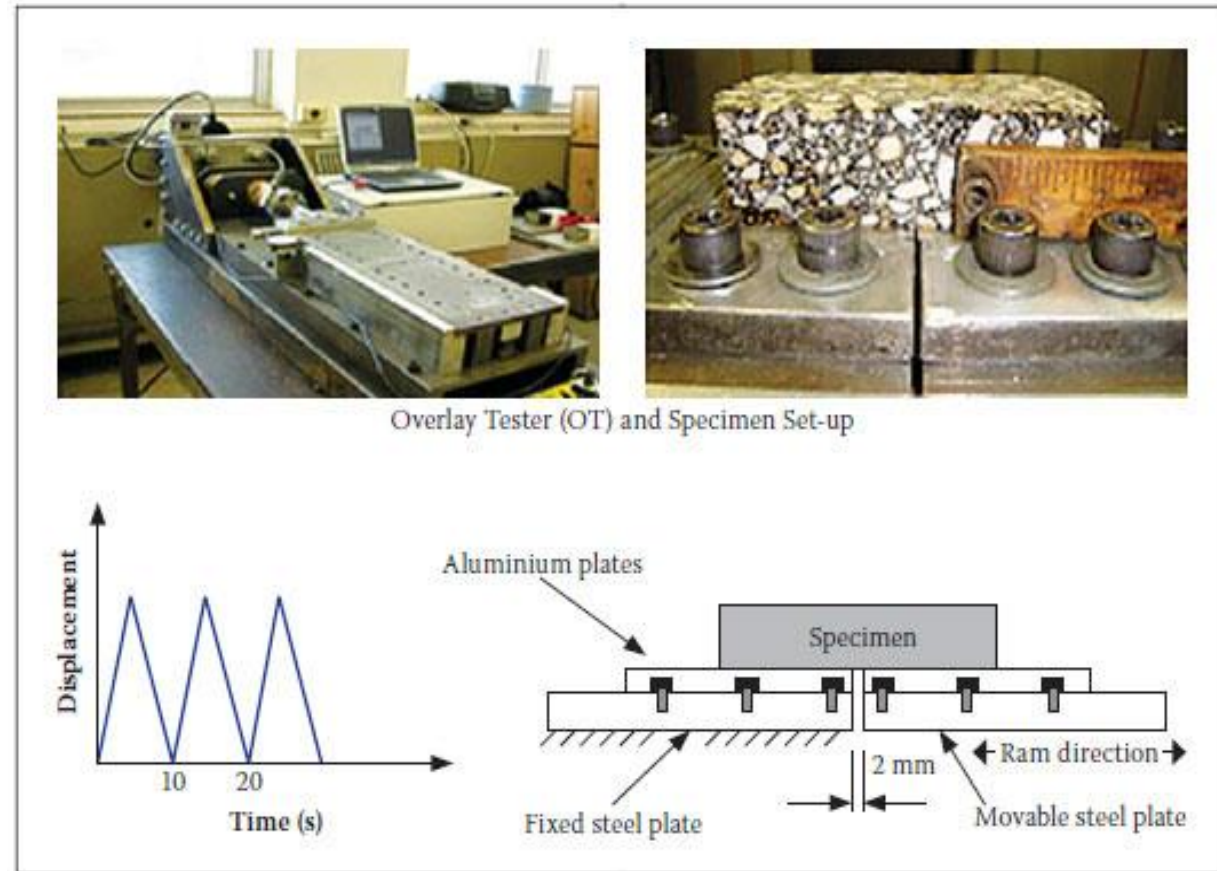

Pressure Aging Vessel (PAV)

- ❖ Simulates long-term aging of the binder using heat and pressure
- ❖ Temperature: 90, 100, or 110 °C
- ❖ Pressure: 2.1 Mpa
- ❖ Time : 20 hours
- ❖ Simulate 7-10 years in service aging

Texas Overlay Test

- ❖ Evaluates the susceptibility of asphalt mixtures to fatigue and reflective cracking
- ❖ Applies repeated tension loads to the specimen to simulate repeated opening and closing of pavement joints and cracks due to temperature variations and traffic loading
- ❖ Designed by Texas Department of Transportation

Asphalt Pavement Weathering System (APWS)

- ❖ Accelerated pavement weathering
- ❖ Simulates natural pavement weathering (top to down) with parameters such as moisture (rain), UV (sunshine) and temperature
- ❖ Incorporates full-depth samples

Binder Tests

❖ Aging (PAV):

Standard: 20 hours (Plus RTFO)

Extended: 60 hours

❖ Virgin Binder: Two samples PG 67-22

True High Temperature Grade: Binder 1: 68.36 °C; Binder 1: 71.63°C

❖ Rejuvenators:

HPE: Heavy Paraffinic Distilled Solvent Extract

CWE: Water-based Emulsion From Wax Free Naphthenic Crude With Residue Content Of 60%

Binder Tests

Mixtures Tests

Conclusions

Discussions:

- ❖ Recycled samples had significantly lower creep stiffness than virgin binders. Also the m-value was generally higher for recycled samples.
- ❖ By increasing the aging from the standard to the extended aging, the stiffness of all samples increased and their m-value dropped.
- ❖ Even after 60 hours of PAV aging, the stiffness of recycled binders was lower than the stiffness limit for PG67-22 ($S \leq 300$ MPa at -12°C). However, in most cases the m-values were too low and did not meet the requirement ($m \geq 0.300$ at -12°C)
- ❖ Both Rejuvenators enhanced the cracking resistance as characterized by a lower creep stiffness and higher m-value.

Mixture Tests

- ❖ **Texas Overlay Test for:**
 - **Recycled and new mixture**
 - **Before and after APWS aging**
- ❖ **Two recycled mixtures and two Control (new) mixtures**
- ❖ **APWS aging for 3000 and 6000 hours**
- ❖ **A 3,000-hour APWS exposure simulates the aging that occurs in the field in 7 to 10 years**

Sample Preparation

Recycled Mixtures

- Two recycled samples (CWE and HPE)
- RAP obtained from a hot in-place recycling project in Florida, USA
- Rap binder recovered to characterize and establish softening curves
- The same rejuvenators used for binder test used for rejuvenating the RAP
- 3% screening sand

Sample Preparation

Control Mixtures

❖ Control I:

- Aggregate extracted from the RAP using ignition oven
- Mixed with PG 67-22 virgin binder with a binder content similar to the RAP (6.3%)

❖ Control II: Mixtures commonly used in Florida

➤ All pills prepared using Gyrotory Compactor with 50 gyrations

Introduction

Research Objectives

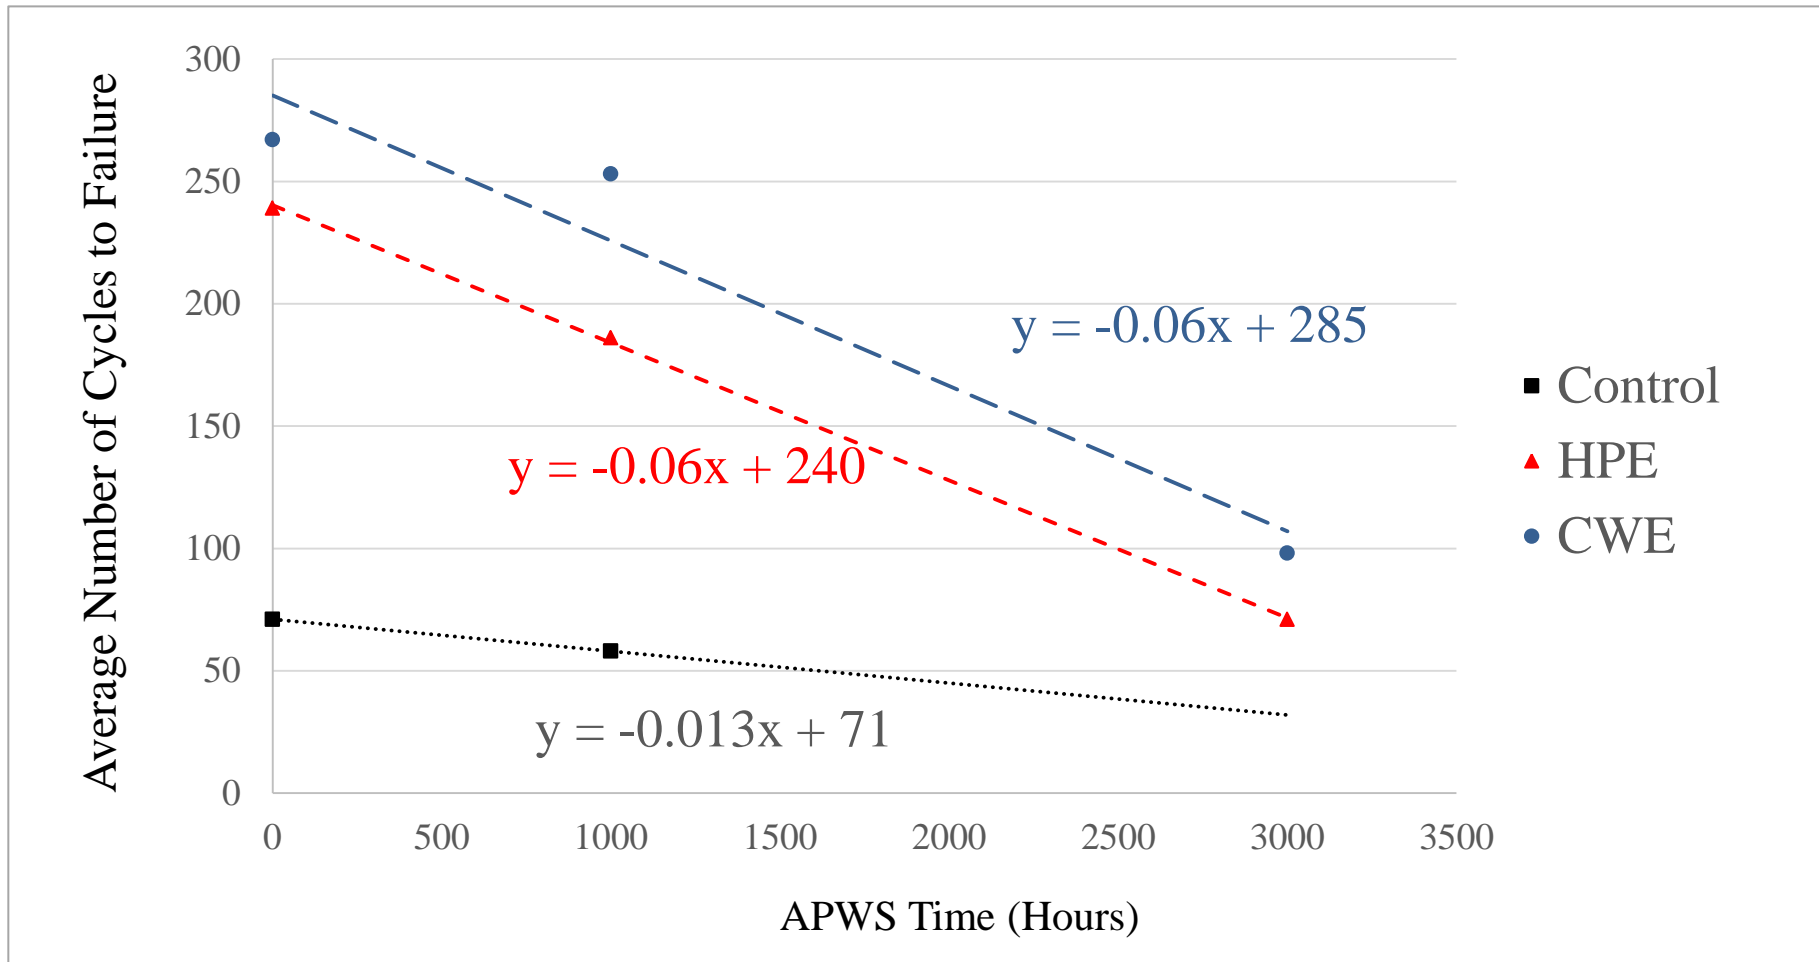

Methodology

Binder Tests

Mixtures Tests

Conclusions

Results

Discussions

- ❖ **The Average Number of Cycles to Failure (ANCF) was considered an indication of susceptibility of mixtures to fatigue and reflective cracking**
- ❖ **Both recycled samples performed much better than both control samples at the initial stage (before aging) . Their ANCF was significantly higher, meaning that they had much better cracking resistance**
- ❖ **The ANCF decreases with increased APWS aging time.**
- ❖ **The rate of decrease in the ANCF with APWS time was considerably faster for recycled mixtures than for the control I.**
- ❖ **However, even at the end of 3,000 hours, recycled samples had an equally good or better resistance to cracking when compared with un-aged control samples.**

Discussions - Continued

- ❖ The recycled samples which were rejuvenated by CWE were found to have a better performance than those rejuvenated by HPE
- ❖ **Limitations:**
 - The variability of Texas Overlay Test results
 - The variability of the air voids between the control and recycled samples
 - The relatively small size of this experiment.

Conclusions

- ❖ Generally, recycled binders had significantly better cracking resistance than virgin binders. This fact was observed in both binder and mixture testing. This observation confirms that a properly recycled pavement can be even more resistant to cracking than a new pavement
- ❖ In the binder testing, no consistent trend was observed in comparing the rate of decrease in cracking resistance of rejuvenated and virgin binders due to aging.
- ❖ The cracking resistance of recycled samples dropped faster. But because of the significant difference in the initial values, even after aging recycled samples had a better cracking resistance
- ❖ The cracking resistance of recycled mixtures was affected by the type of rejuvenator.

Thank You
