

Radio-immunotherapy of cancer

Therapeutic efficacy, underlying mechanisms and potential applications

Paula Kroon, Nicole Haynes, Victoria Iglesias-Guimaraes, Ricky Johnstone, Jules Gadiot, Marcel Verheij, Christian Blank, Jacques Neefjes, Jannie Borst, Inge Verbrugge

Curing metastatic cancer with systemic therapy

- Immunotherapy
 - Eliciting anti-tumor cytotoxic T cell responses

Established tumors are poorly immunogenic

Bottlenecks

- Lack of 'foreign' antigens
 - T cells do not recognize tumor cells
- Inhibition CTL activity by tumor / tumor micro-environment
 - PD-1 signaling
 - MHC I downregulation tumor cells

T cell-mediated immunotherapy; Signal (1) TCR triggering

T cell-mediated immunotherapy; Signal (2) co-stimulation

Antibody-based immune-modulation

Blocking co-inhibition
'release the brake'

α -PD-1, α -CTLA-4

Pembrolizumab
Nivolumab

Ipilimumab

Antibody-based immune-modulation

Co-stimulation
'press the gas'

Antibody-based immune-modulation

Problem:

Immunotherapy as single-agent promising, but sub-optimal

Solution:

Combine immunotherapy with radiotherapy

‘Radio-immunotherapy’

Radiotherapy

DNA damage

1. Reducing tumor cell clonogenicity
- (Irreversible) cell cycle arrest
 - Mitotic catastrophe
 - Apoptosis

Radiotherapy

DNA damage

1. Reducing tumor cell clonogenicity
 - (Irreversible) cell cycle arrest
 - Mitotic catastrophe
 - Apoptosis

2. Immunomodulatory effects
 - Induce anti-tumor immune responses through release of tumor Ags
 - Upregulate MHC I

1) Efficacy?

2) Mechanism?

3) Potential applications?

Transplantable AT-3 breast cancer model

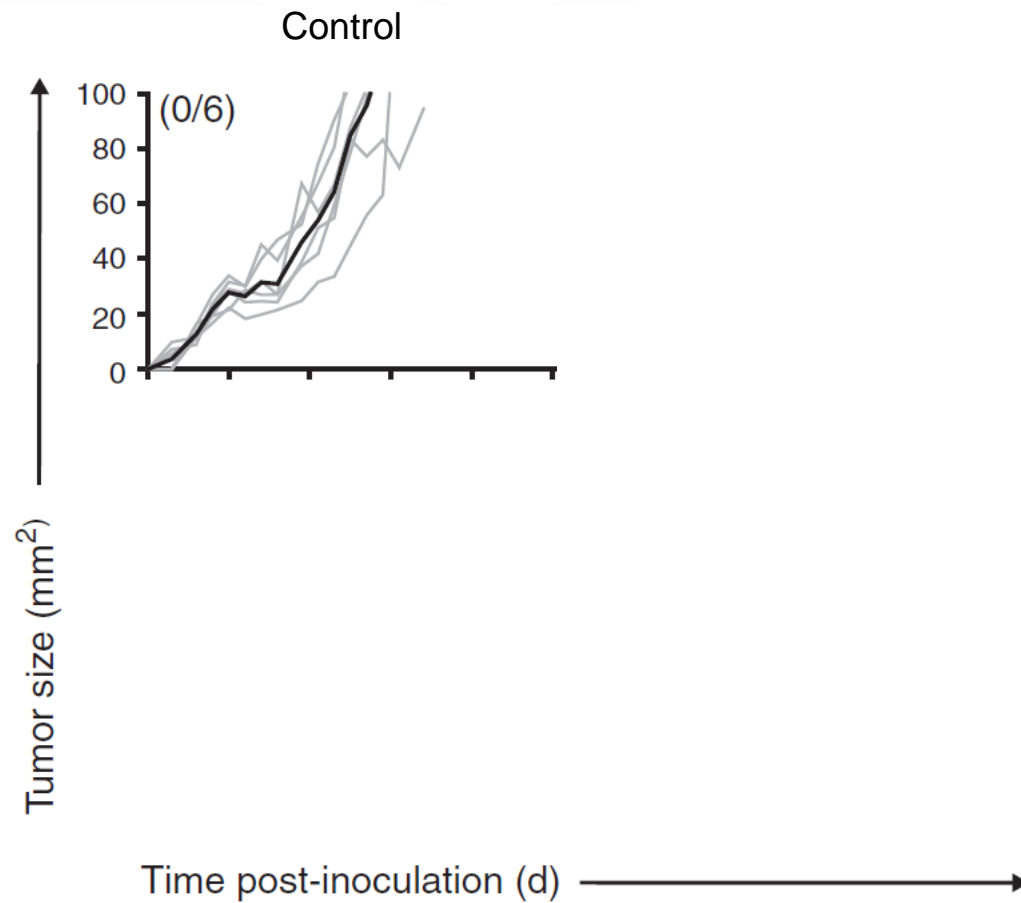

- Triple-negative breast cancer cell line

Small animal Image-Guided Radiotherapy

Radiotherapy improves the response to immunotherapy

1) Efficacy?

2) Mechanism?

3) Potential applications?

Immune cells

vs.

Tumor cells

Immune cells

vs.

Tumor cells

CD8+ T cells crucial for radio-immunotherapy

IR+IT: radio-immunotherapy
Start Tx: Day 14
n = 6 mice /group

Immune cells

vs.

Tumor cells

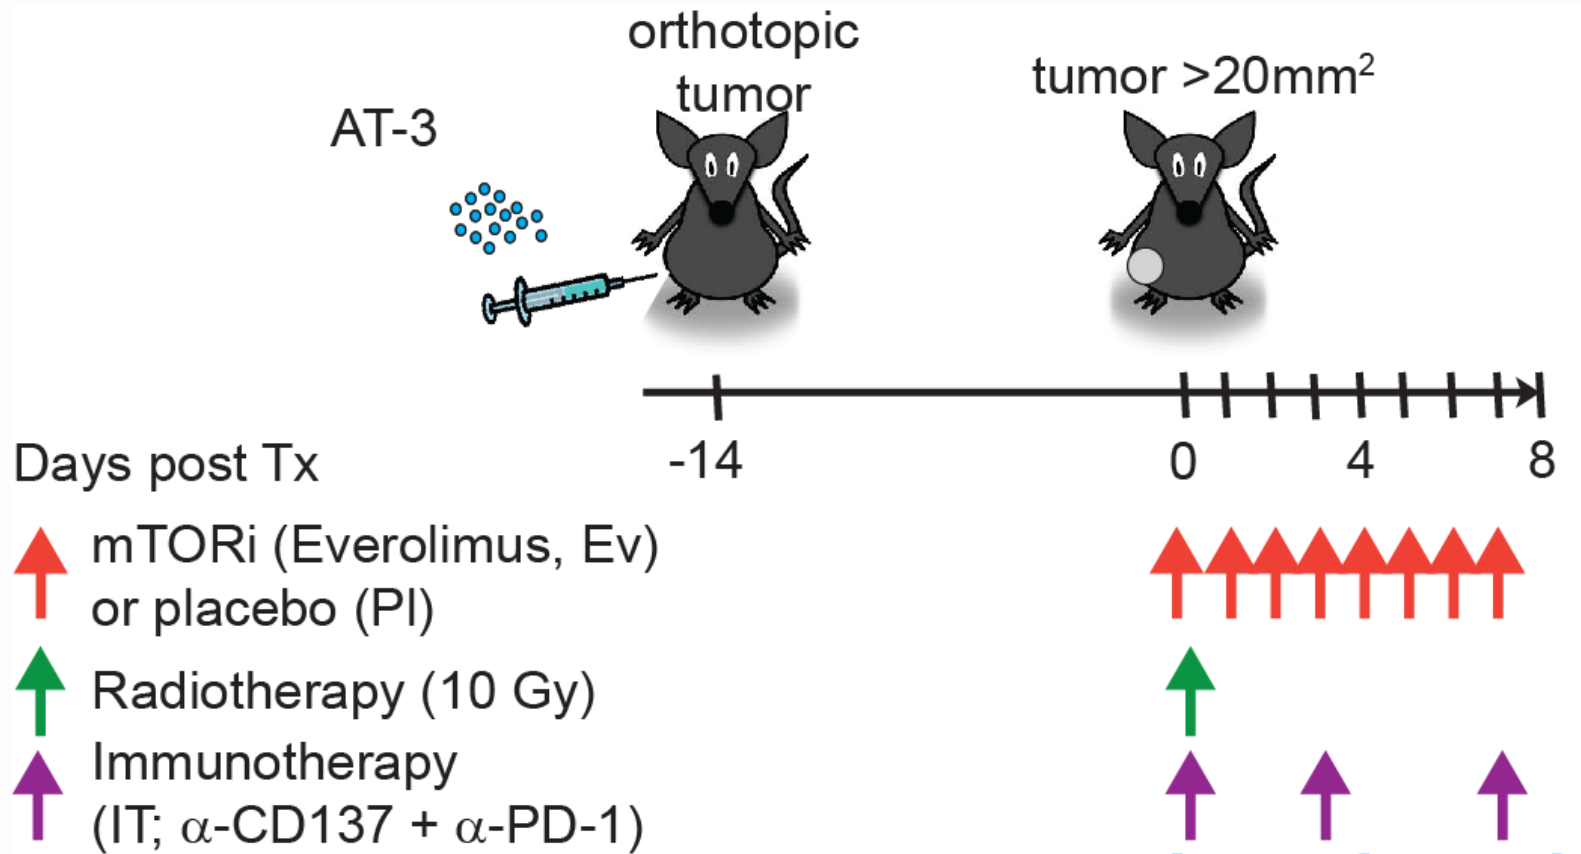

Radiotherapy upregulates surface MHC I on AT-3 tumor cells

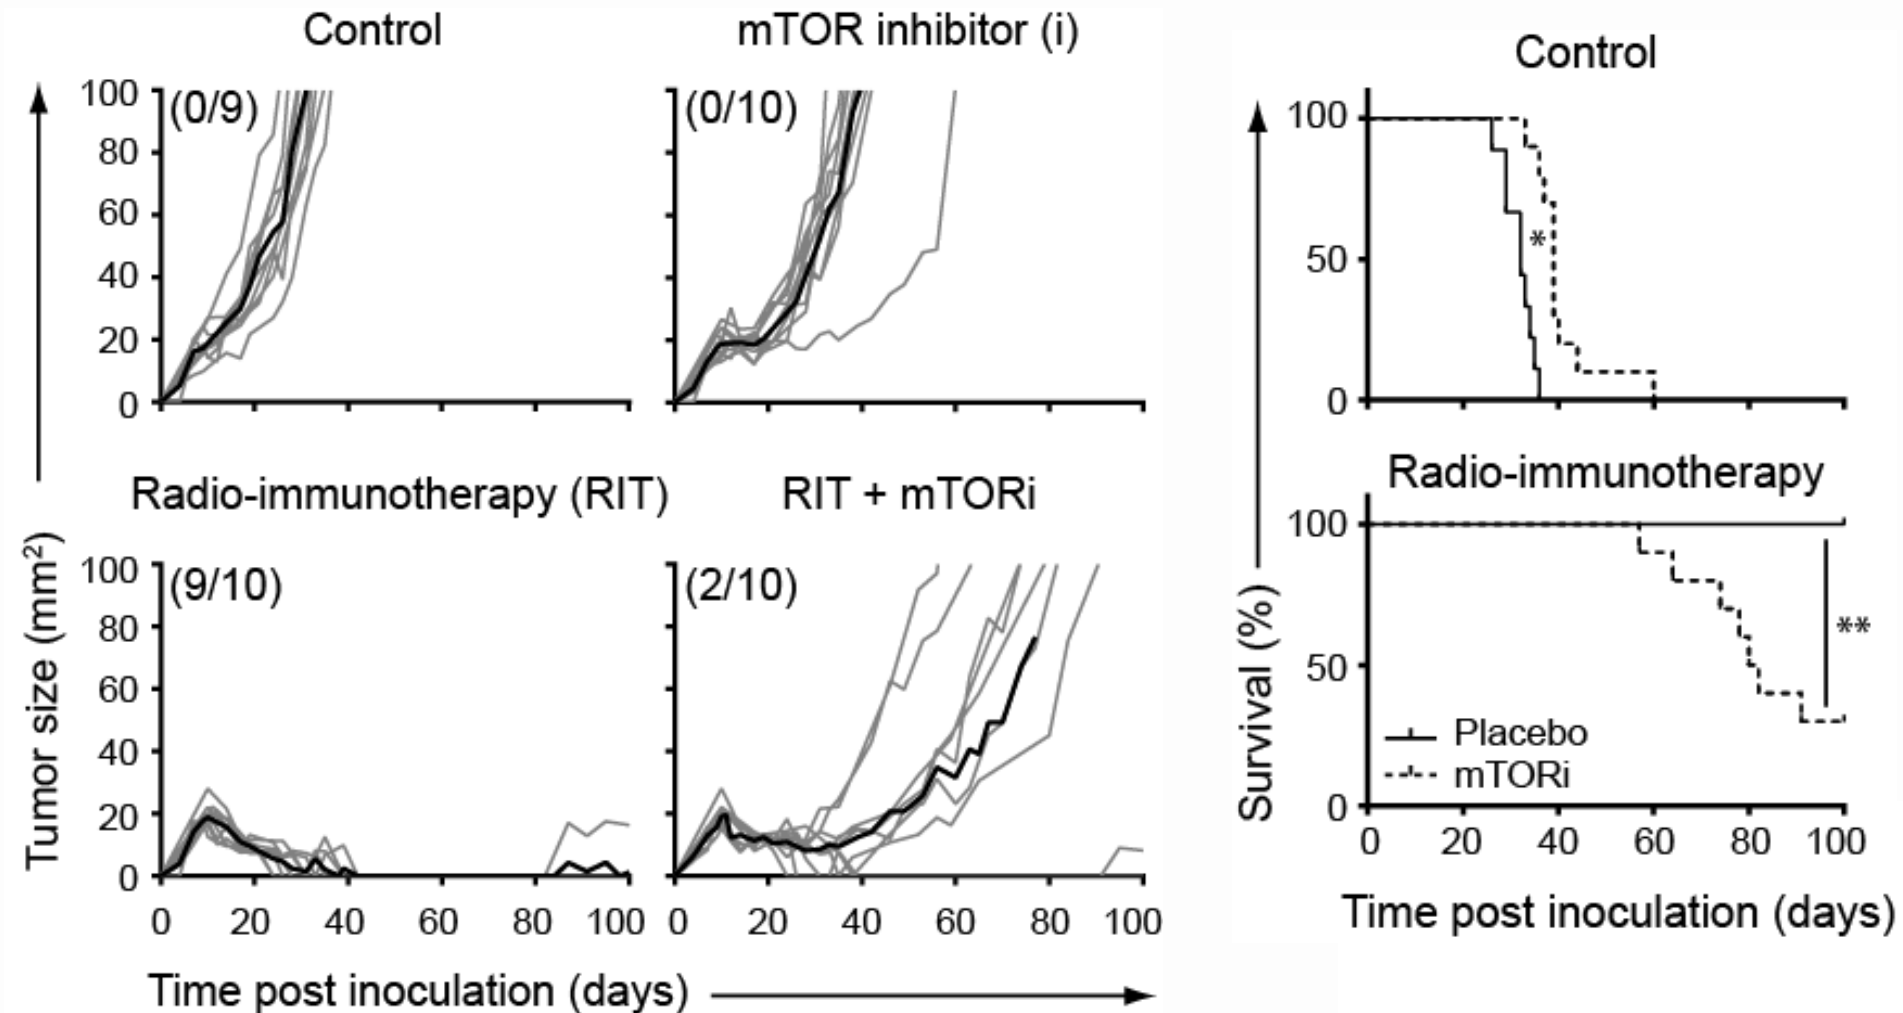

mTOR inhibition abrogates Radiotherapy-induced MHC I upregulation

Importance of mTOR signaling to the therapeutic effect of radio-immunotherapy

Inhibition of mTOR signaling abrogates the therapeutic response to radio-immunotherapy

Radio-immunotherapy: summary and potential applications
