# Cyanidin-3-O-glucoside ameliorates lipid and glucose accumulation in C57BL/6J mice via activation of PPAR- $\alpha$ and AMPK

*Food Biomedical Science Lab.*  
*Yaoyao Jia*  
*Sep 23<sup>th</sup>, 2014*

# Background

## Previous study about cyanidin (CY)

Molecular mass: 287.24g/mol

$K_D$  values and  $EC_{50}$  values of cyanidin (CY)

	C3G	
	PPAR $\alpha$	LXR $\alpha$
SPR	3.08 $\mu$ M	2.2 $\mu$ M
TR-FRET	3.03 $\mu$ M	3.5 $\mu$ M

Cyanidin is an agonistic ligand for peroxisome proliferator-activated receptor-alpha reducing hepatic lipid

HepG2 cells

Intracellular triglyceride

Intracellular cholesterol

THP-1 cells

Triglyceride

Cholesterol

# Background

## ➤ Berries containing C3G regulate lipid and glucose metabolisms

### Peroxisome proliferator-activated receptors (PPARs):

- Nuclear receptors
- Containing 3 isoforms: PPAR $\alpha$ , PPAR $\gamma$ , PPAR $\delta/\beta$

### PPAR $\alpha$ :

- A major regulator of lipid metabolism in the liver
  - Fatty acid uptake (fatty acid transport)
  - Fatty acid utilization (fatty binding and activation)
  - Fatty acid catabolism (peroxisomal and mitochondrial fatty acid  $\beta$ -oxidation)
  - Ketogenesis
  - Triglyceride turnover
- Ligands:
  - Synthetic ligands include the fibrate drugs (hyperlipidemia)
  - Endogenous ligands include fatty acids and various fatty acid-derived compounds

### AMP-activated protein kinase (AMPK):

- An enzyme plays a role in cellular energy homeostasis
- Consists of three proteins (subunits):  $\alpha$ ,  $\beta$ , and  $\gamma$
- Three subunits together make a functional enzyme

### AMPK:

- Stimulate:
  - Fatty acid oxidation
  - Ketogenesis
- Inhibit:
  - Lipogenesis
  - Triglyceride synthesis
  - Gluconeogenesis

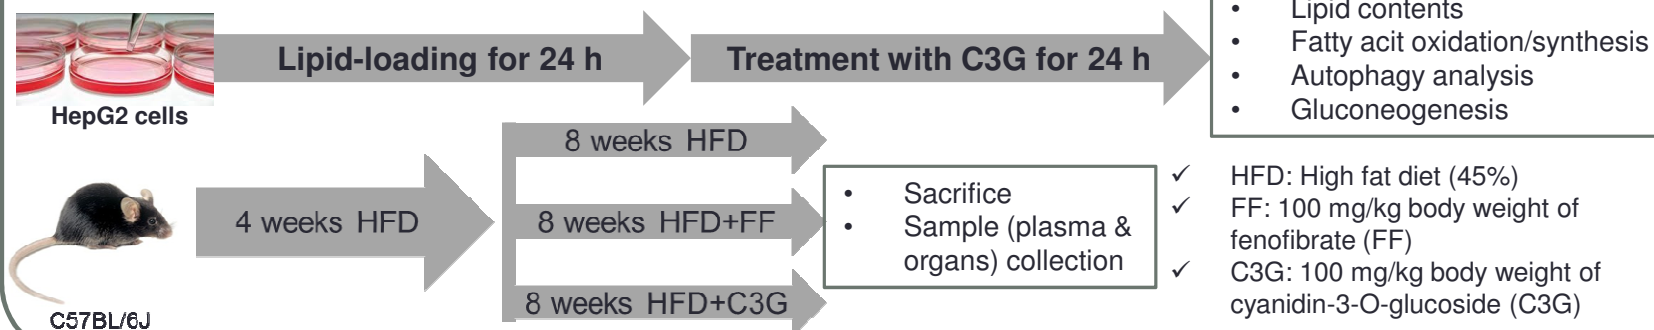

\* RXR: retinoid X receptor

PPRE: peroxisome proliferator hormone response elements

# Experimental design

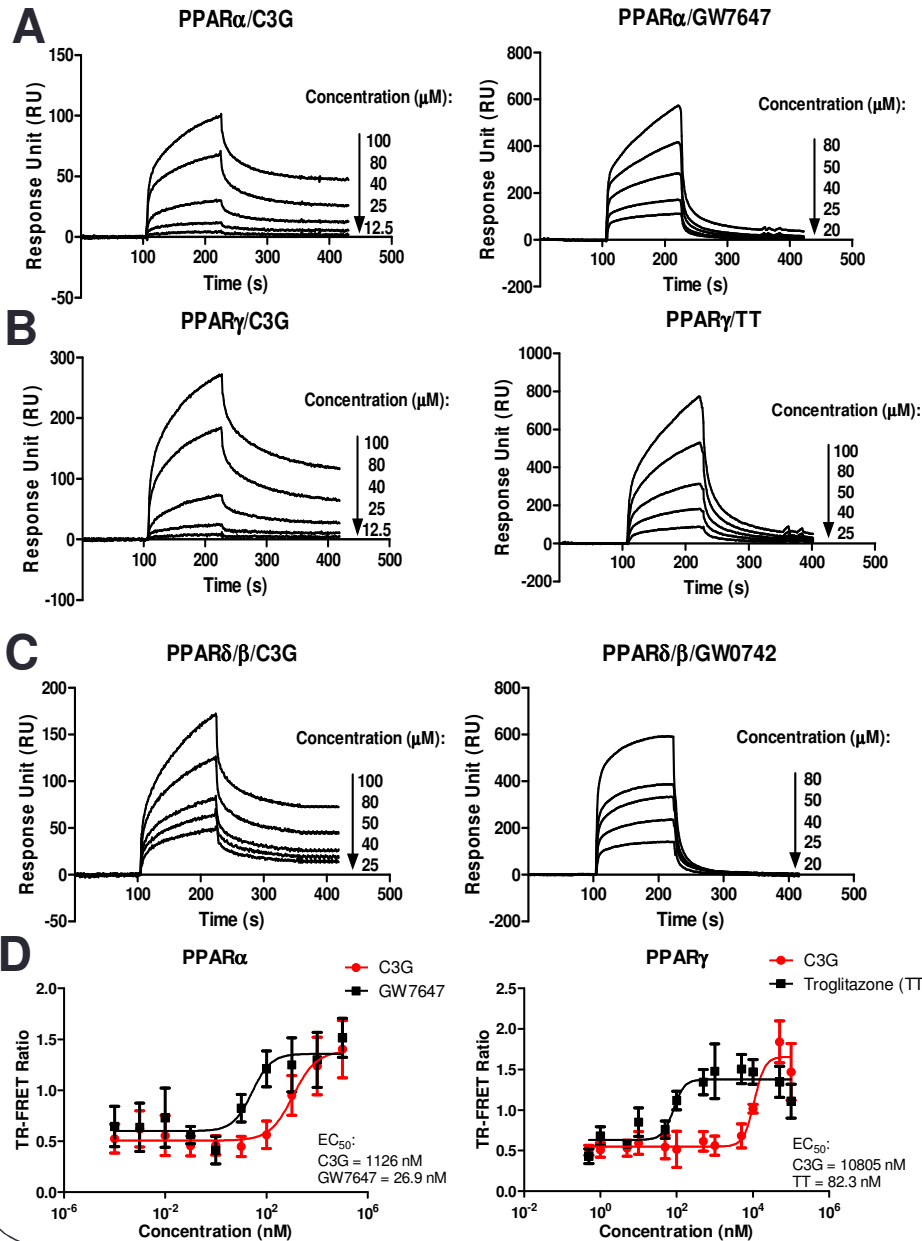

- ❑ Molecular targets of C3G
  - ✓ BIAcore Surface plasmon resonance (SPR)
  - ✓ Time resolution-fluorescence resonance energy transfer (TR-FRET) coactivator assay
  - ✓ AMPK activity assay

## ❑ Animal/cell experimental design

- ❑ Physiological relevance & molecular mechanisms of C3G
  - ✓ Body & organ weight measurement
  - ✓ Plasma lipid, glucose, insulin & hormone measurement
  - ✓ Liver & adipose tissue histology & analysis
  - ✓ Liver lipid concentration measurement
  - ✓ Oral glucose tolerance test (OGTT)
  - ✓ Insulin tolerance test (ITT)
  - ✓ Autophagy pathway analysis
  - ✓ qPCR & immunoblotting

# C3G induces PPAR $\alpha$ coactivator activity via direct binding to PPAR $\alpha$

## Time resolution-fluorescence resonance energy transfer (TR-FRET) coactivator assay

## K<sub>D</sub> values and EC<sub>50</sub> values of C3G and positive controls

	C3G			Positive controls		
	PPAR $\alpha$	PPAR $\gamma$	PPAR $\delta$	PPAR $\alpha$	PPAR $\gamma$	PPAR $\delta$
SPR	456 nM	1.36 $\mu$ M	4.96 $\mu$ M	13.2 nM	377 nM	102 nM
TR-FRET	1126 nM	10.8 $\mu$ M	31.05 $\mu$ M	26.9 nM	82.3 nM	10.25 nM

K<sub>D</sub>, the equilibrium dissociation constant ('binding constant');  
 EC<sub>50</sub>, Half maximal effective concentration

# C3G induces AMPK $\alpha$ 1 activity via direct interaction with AMPK $\alpha$ 1

**A**

**B**

EC <sub>50</sub> (nM)	A1/B1/G1	A2/B1/G1
A-769662	262	457
C3G	599	1010

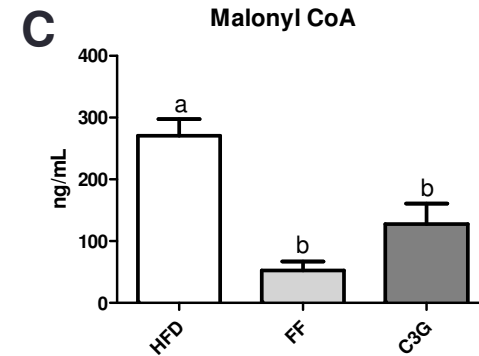

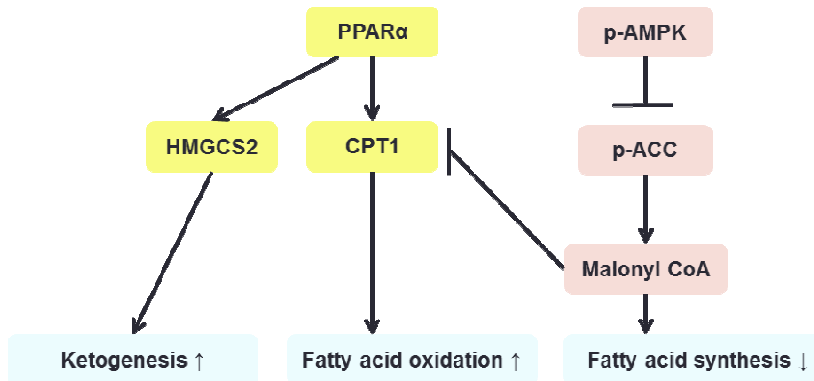

➤ **C3G directly activates PPAR $\alpha$  and AMPK**

# C3G reduces lipid accumulation in mouse livers & hepatocytes

AST, Aspartate Aminotransferase;  
ALT, Alanine Aminotransferase

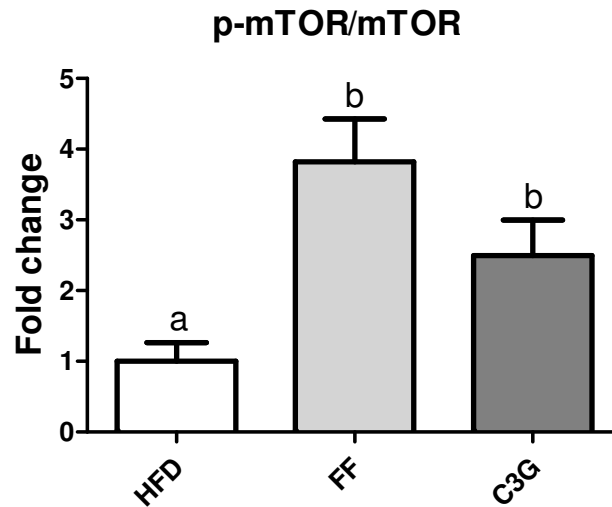

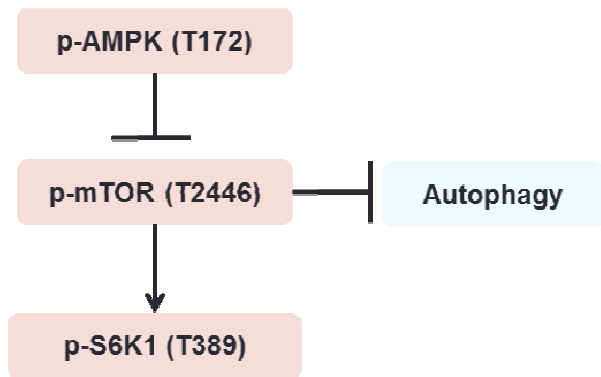

# C3G induces hepatic fatty acid oxidation and ketogenesis while decreases fatty acid synthesis via regulation of PPAR $\alpha$ & AMPK $\alpha$ 1

➤ **C3G reduces lipid accumulation via increases fatty acid oxidation, ketogenesis, whereas inhibits fatty acid synthesis**

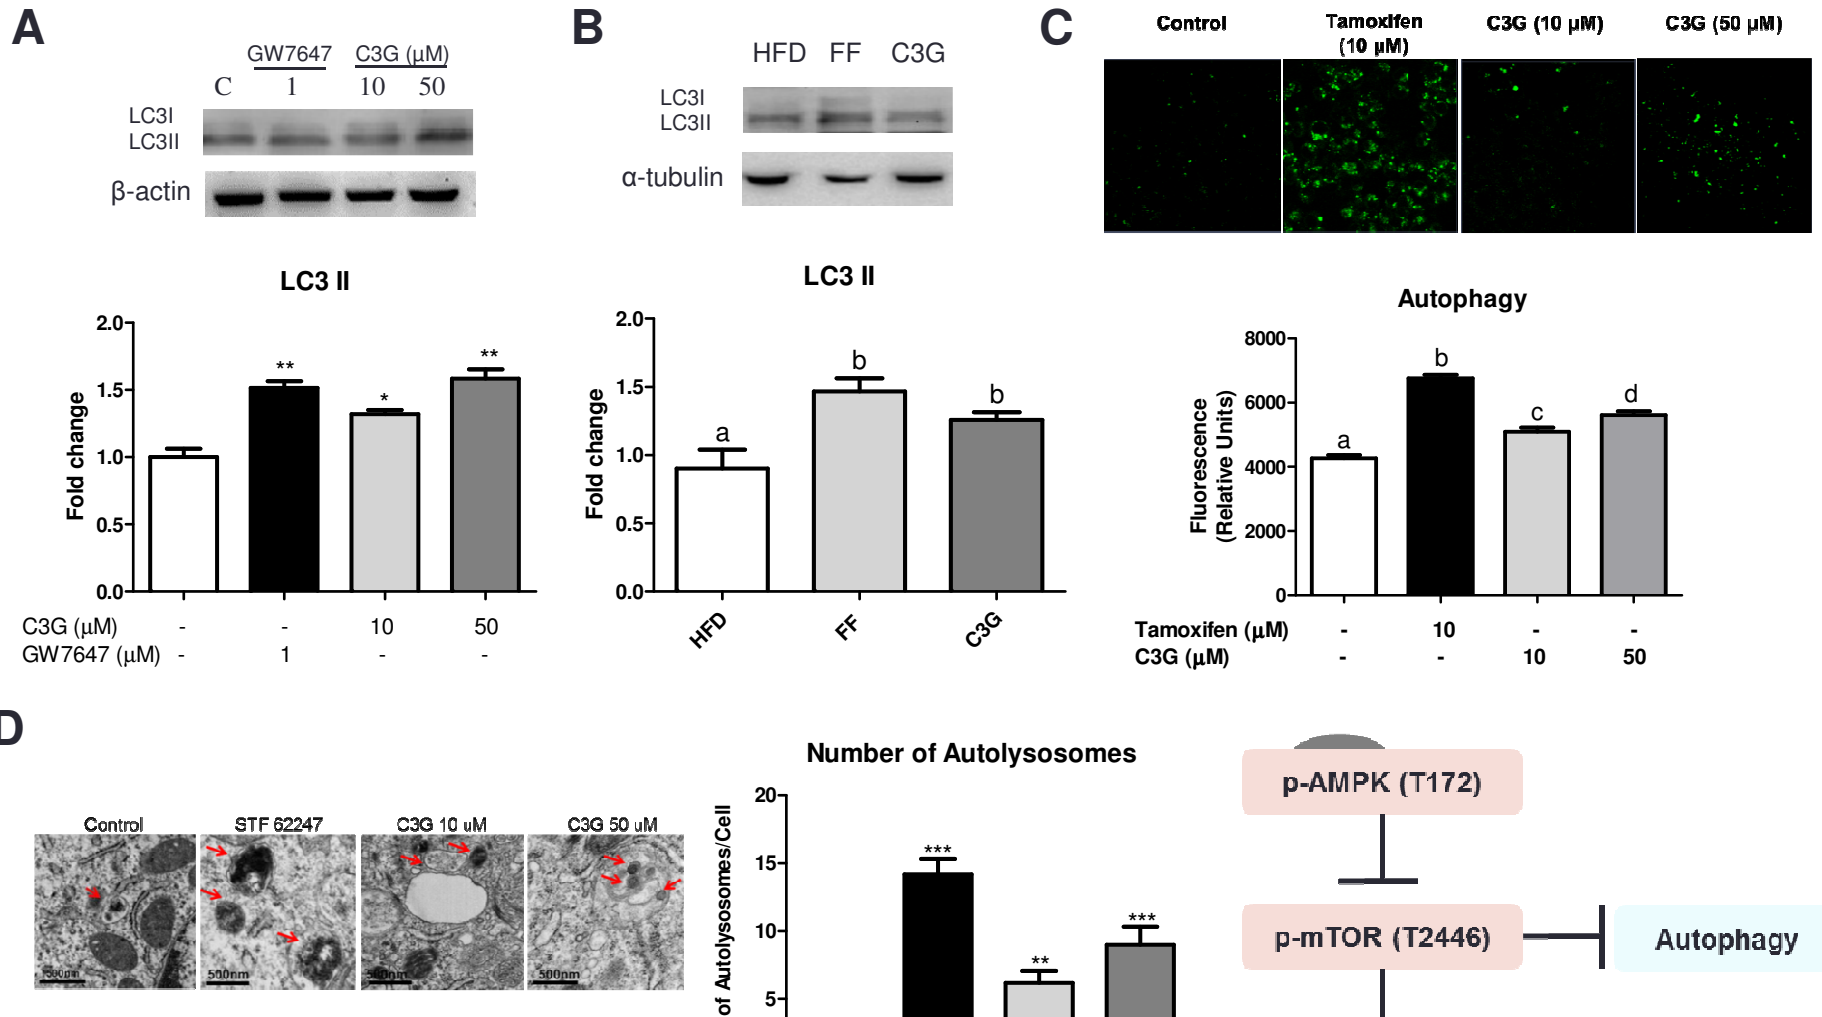

# C3G induces phosphorylation of AMPK thus blocks the mTOR-S6K1 axis

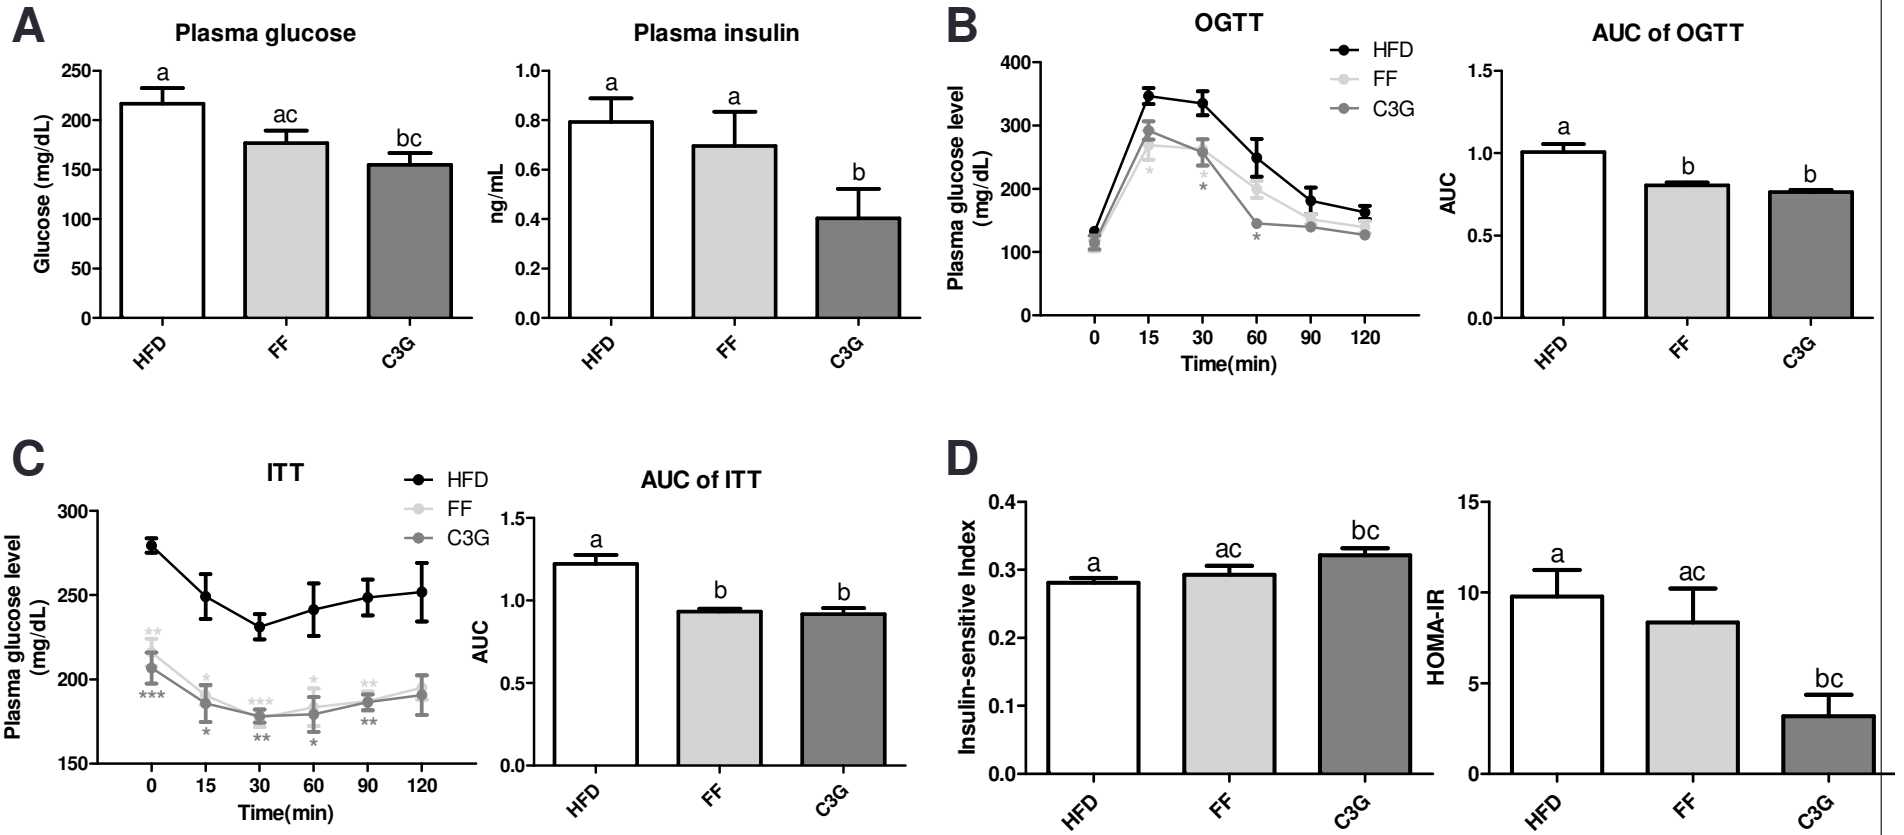

mTOR, mammalian target of rapamycin; S6K1, P70-S6 Kinase 1

# C3G induces hepatic autophagy pathway

➤ **C3G reduces lipid accumulation via activates hepatic autophagy pathway**

# C3G reduces plasma glucose & insulin concentrations and improves insulin sensitivity

HOMA-IR, Homeostatic Model Assessment - Insulin Resistance; AUC, Area under the curve

# C3G reduces gluconeogenesis

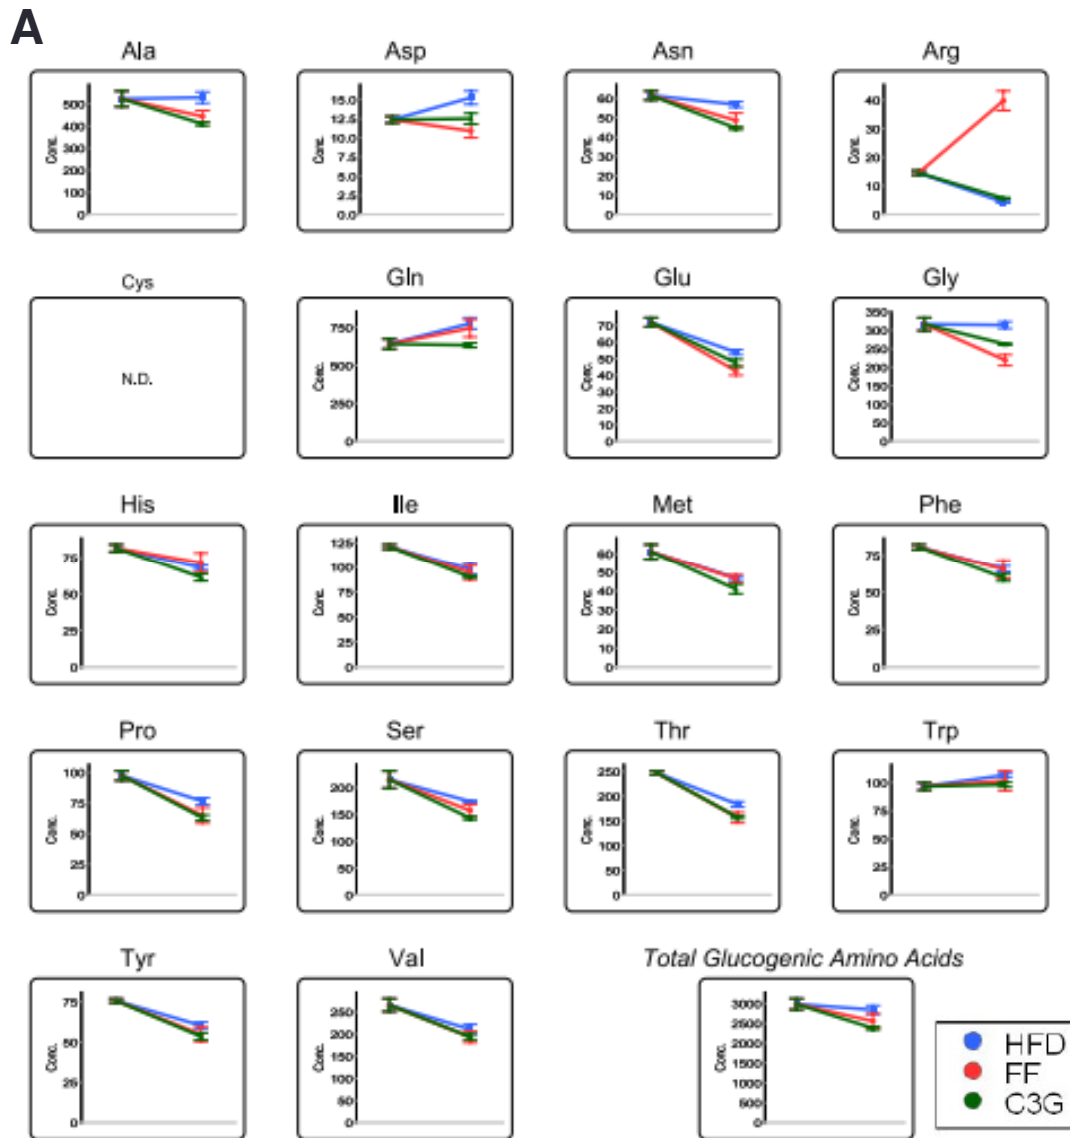

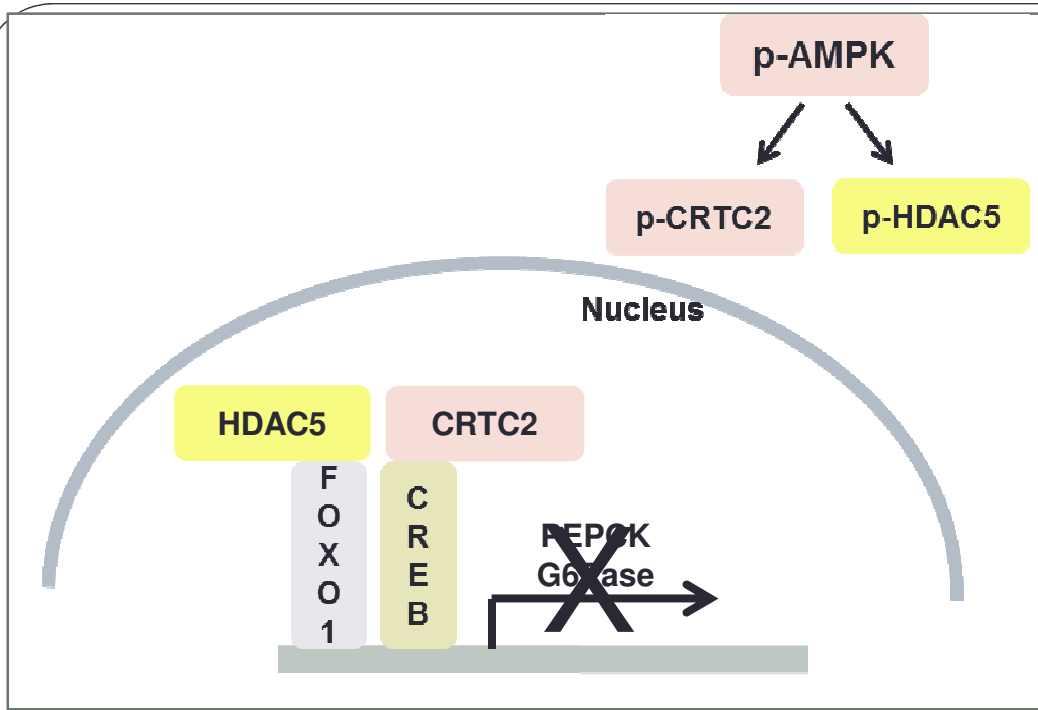

Fig. 22: Total Glucogenic Amino Acids

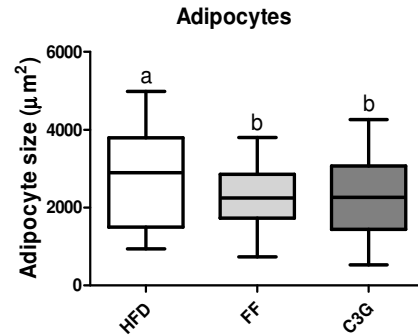

Increases plasma adiponectin  
B activity

➤ **C3G reduces glucose accumulation via inhibits hepatic gluconeogenesis**

FOXO1, Forkhead box protein O1; CREB, cAMP response element-binding protein; HDAC5, Histone deacetylase 5; CRTC2, CREB regulated transcription coactivator 2; PEPCK, Phosphoenolpyruvate carboxykinas; G6Pase, Glucose 6-phosphatase

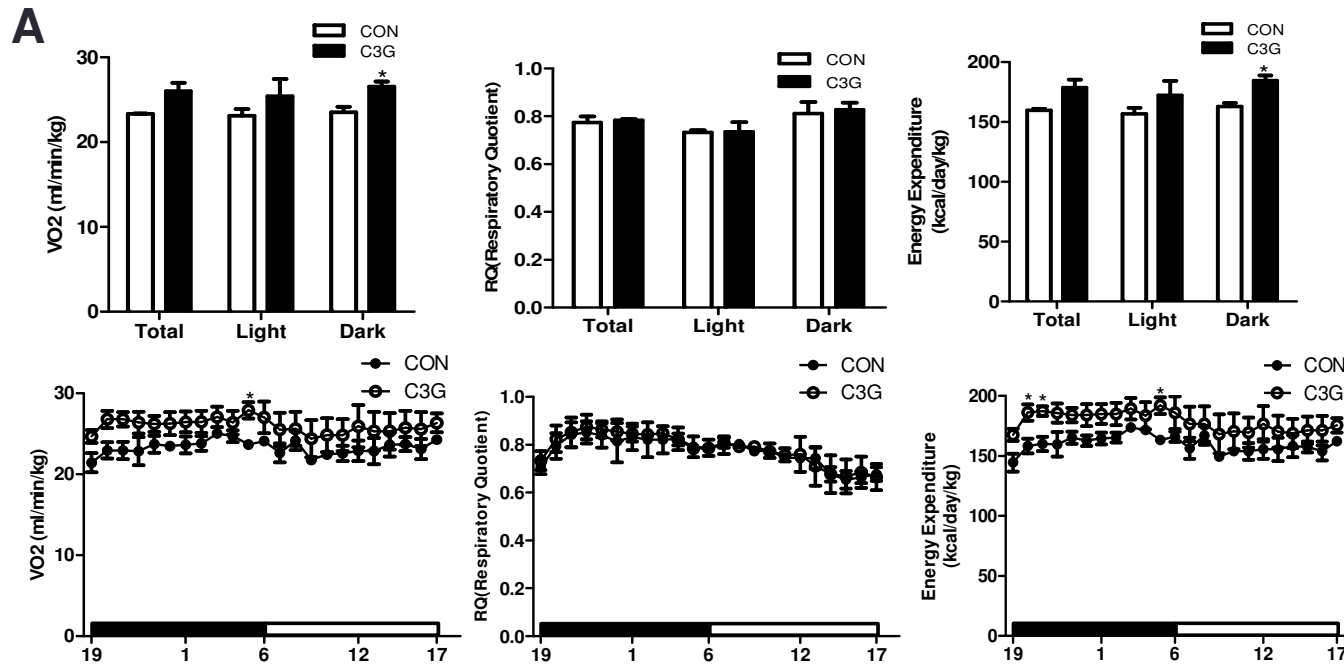

# C3G reduces body weight, visceral fat weight & adipocyte size

Organ weight of mice

	HFD	FF	C3G
Epididymal Fat (g)	2.45 ± 0.16 <sup>a</sup>	2.43 ± 0.26 <sup>a</sup>	2.41 ± 0.19 <sup>a</sup>
Visceral Fat (g)	1.67 ± 0.11 <sup>a</sup>	0.71 ± 0.09 <sup>bc</sup>	0.98 ± 0.19 <sup>c</sup>
Perirenal Fat (g)	1.52 ± 0.10 <sup>a</sup>	1.02 ± 0.09 <sup>bc</sup>	1.19 ± 0.15 <sup>ac</sup>
Total White Adipose Tissue (WAT, g)	5.63 ± 0.20 <sup>a</sup>	4.16 ± 0.42 <sup>bc</sup>	4.58 ± 0.52 <sup>ac</sup>
Brown Adipose Tissue (BAT, g)	0.29 ± 0.03 <sup>ab</sup>	0.22 ± 0.03 <sup>a</sup>	0.36 ± 0.04 <sup>b</sup>
WAT/BAT	20.81 ± 2.07 <sup>a</sup>	19.90 ± 1.52 <sup>a</sup>	12.90 ± 0.87 <sup>b</sup>
Skeletal Muscle (g)	0.68 ± 0.04 <sup>a</sup>	0.55 ± 0.08 <sup>a</sup>	0.76 ± 0.06 <sup>a</sup>
WAT/Skeletal Muscle	8.43 ± 0.49 <sup>a</sup>	7.98 ± 0.58 <sup>ab</sup>	5.85 ± 0.80 <sup>b</sup>
Liver (g)	1.59 ± 0.13 <sup>a</sup>	1.46 ± 0.05 <sup>a</sup>	1.37 ± 0.17 <sup>a</sup>
Liver/Body weight	0.036 ± 0.002 <sup>a</sup>	0.040 ± 0.001 <sup>a</sup>	0.034 ± 0.003 <sup>a</sup>

# C3G increases energy expenditure via induces thermogenesis gene expressions in brown adipose tissue (BAT)

➤ **C3G reduces body weight via increases energy expenditure and thermogenesis in brown adipose tissue**

# Conclusion

- ✓ ↓ Body weight, visceral fat weight & adipocyte size
- ✓ ↓ Lipid accumulation in liver
- ✓ ↓ Glucose & insulin concentrations in plasma
- ✓ Improves insulin sensitivity

↓ Atherosclerosis
