Prevention of falls in older age: The role of physical activity

Dr Anne Tiedemann
Senior Research Fellow
Prevention of Falls Network Europe (ProFaNE) definition¹:

‘an unexpected event in which the participant comes to rest on the ground, floor, or lower level’

**NOT** as the result of an external force (e.g. being pushed)
**NOT** as a result of loss of consciousness (e.g. stroke)

Epidemiology

Falls in older age are **common**:
- 1 in 3 community-dwellers over 65 fall at least once each year
- 1 million older Australians & 12 million older Americans fall/year
- Every 29 mins in the US an older person dies as a result of a fall
- 1 in 2 people living in residential aged care fall each year

**Ageing population**:
- Approx. 1 in 4 Australians and 1 in 5 Americans will be aged 65+ by 2050

Falls have **serious consequences**:
- Social, economic, ongoing disability
Falls frequency increases with age

![Graph showing the percentage of falls by age group. The graph indicates that the percentage of falls increases with age.](image-url)
Impact of falls: personal costs

Morbidity and mortality

- Leading cause of injury-related death in older adults
- Leading cause of hospitalisation in older adults
- 20-60% of older people suffer injuries from falls
- 10% result in death
- 10-15% are serious injuries (eg. fractures)
  - 1 hip fracture costs $10,000
  - 25% patients die within 12 months
  - 25% never regain their pre-fracture mobility
Risk factors for falls

**Medical Conditions**
- Stroke
- Incontinence
- Parkinson’s disease
- Dementia

**Medications**
- Psychoactives
- Four or more medications

**Psychosocial & Demographic**
- History of falls
- Depression
- Advanced age
- Living alone
- ADL limitations
- Female gender
- Inactivity

**Sensorimotor & Balance**
- Muscle weakness
- Impaired vision
- Reduced peripheral sensation
- Poor reaction time
- Impaired balance

**Environmental**
- Poor footwear
- Home hazards
- External hazards
- Inappropriate spectacles

**Falls**
Fall risk factors: A fall occurs when an individual's physiology can’t cope with a task being undertaken and/or the environment in which the task is being undertaken.

- **Disease/medication**
- **Ageing**
- **Inactivity**

- **Physical factors:** balance strength, vision sensation reaction time, cardiovascular

- **Cognition**
- **Insight**
- **Attitudes**
- **Distraction**

- **Behaviour:** choice of activity and care taken when doing it

- **Environmental hazards:** home and elsewhere

- **Environment triggers**
Interventions to prevent falls

Interventions for preventing falls in older people living in the community (Review)

Single interventions for preventing falls

• Interventions to maximise vision
• Interventions to reduce medication use
• Home modification programs
• Cardiovascular interventions
• Podiatry
• **Exercise**
Exercise to prevent falls in older adults: an updated meta-analysis and best practice recommendations

*Catherine Sherrington*<sup>A,B,E</sup>, *Anne Tiedemann*<sup>A,B</sup>, *Nicola Fairhall*<sup>A,C</sup>, *Jacqueline C.T. Close*<sup>B,D</sup> and *Stephen R. Lord*<sup>B</sup>

Are there bigger effects on falls in studies with different:
- exercise program components?
- populations?
- design features?

health services and the community. This impact will grow substantially in the near future due to the increased proportion of older people in the population. The proportion of Australians aged 65 years and over is predicted to increase from 14% (3 million people) in 2010 to 23% (8.1 million people) by 2050. By 2051, the Australian

60 group comparisons

Overall effect of exercise on falls:

RaR = 0.84

95% CI 0.77 to 0.91

(16% reduction in rate of falls)
Differences between study findings

Greater effects on fall rates from exercise programs which:

- challenge balance
- include 50+ hours of prescribed exercise
- don’t include a walking program

= 64% of variance explained
Balance training intensity

Balance training intensity

Low challenge (n=30)
6%
(95%CI 0 to 17)

High challenge (n=30)
25%
(95%CI 15 to 34)
DEFINITION

• High = 50 hours of exercise with instructor plus prescribed home exercise over study period.
Dose (50+hours)

Low (n=30)  RR=1

7%  (95%CI 0 to 8)

High (n=30)

23%  (95%CI 13 to 32)
Population (High risk versus general population)

RR=1

High risk (n=39)

Low risk (n=21)

But need to consider effect in terms of absolute number of falls prevented

10% (95%CI 0 to 20)

27% (95%CI 14 to 37)
Inclusion of walking program

RR=1

Walking (n=30)

No walking (n=30)

10%  (95%CI 0 to 22)

23%  (95%CI 11 to 32)
Best combination to maximise effect

- **Balance training+ no walking+ high dose**
  - RR=1
  - 38% (95%CI 27 to 46)

- **Balance training+ walking+ high dose**
  - 21% (95%CI 11 to 30)
Exercise to prevent falls

- **Dose**: at least 2 hours per week and should be ongoing
- **Progression**: ongoing to gain benefit and maintain interest
- **Intensity**: balance challenge needs to be high

- **What do we mean by “balance challenge”?**
- **Exercise in standing involving:**
  - movement of the centre of mass
  - narrowing of the base of support
  - minimising upper limb support
Balance exercises

Aims of balance and mobility exercises

- Improve gait and mobility
- Improve ability with transfers
- Improve leaning, reaching ability
- Improve voluntary stepping
Strength exercise

Aim to increase lower limb muscle strength
– Ankle dorsiflexors and plantarflexors
– Knee extensors and flexors
– Hip muscles (extensors/flexors and abductors/adductors)

• Improve sit to stand and stair climbing ability
• Improve transfers
• Develop power – reaction time tasks
Effective exercise programs

- Otago home-based strength and balance training
- Lifestyle and Functional Exercise (LiFE) program
- Tai Chi
- Yoga?
Can yoga prevent falls?

*RCT, 54 people, aged 60+, community-dwelling

• Intervention: 12 weeks group-based Iyengar-style yoga, 2x/week + home practice, standing balance postures

• Control group: general info about falls risk/prevention

  ▪ Primary outcome: standing balance

  ▪ Secondary outcomes: sit to stand, gait speed, one-legged stand, falls self efficacy

Yoga results

- After 12 weeks, yoga group significantly better than control at:
  - Standing balance
  - Walking quickly
  - Standing on one leg with eyes closed
  - Sit to stand performance

- Excellent adherence: mean class attendance 20/24 classes (83%)
- No serious adverse events

- Conclusion: Yoga shows promise as a falls prevention intervention - large RCT with falls outcome is planned
Exercise summary

- Strong evidence
  - Strength and balance training

- Moderate evidence
  - Weight bearing group exercise with balance exercises
  - Tai Chi
  - Iyengar yoga

- Little evidence
  - General fitness training
  - Seated resistance training
  - Walking
  - Seated exercise
  - Water exercise
Barriers to exercise participation

1. Exercise
2. Exercise
3. Exercise
4. Exercise
5. Exercise
6. Exercise
7. Exercise
8. etc.

Yes, yes, yes—now, seriously, what can we do to improve our health?
Global inactivity

- Only 57% of Australian adults participate in minimum recommended level of physical activity. 

- Of those who start exercise, half dropout within six to 12 months. 
  Dishman, Health Psychology, 1982

- Need to consider strategies for maximising uptake and adherence to falls prevention exercise.
Engaging with older people

- **Yardley and Todd**, UK researchers. Extensive work around attitudes of older people to falls prevention advice and how to successfully engage with them.

- **Findings:**
  - Older people believe that falls prevention information/strategies are **not relevant** to themselves but to **other** older people, who they consider are older and at greater risk of falls.
  - To suggest that falls are personally relevant to older people can be a **threat to their identity**. Older people then more likely to reject information and advice.

- **Poor uptake** (as low as 10%) and adherence to falls prevention interventions is a barrier to their public health impact.
Implications

• Risk reduction messages, such as ‘reducing your risk of falling’ are likely to be ignored
• Messages should promote positive identities that are relevant; -maintaining an independent lifestyle; -staying healthy and physically active; and -promotion of activities that enhance fitness, balance and mobility
• The word “falls” has strongly overriding negative connotations
• Focus on “healthy ageing message” rather than “falls prevention”
• Don’t mention the “f” word!
Future challenges......

- How can we **attract** older people to participate in exercise programs and ensure that they maintain participation?

- How can we **tailor** programs to suit the needs and **preferences** of older people?

- How can we “**market**” programs to suit the older person? e.g. focus on “maintaining independence” rather than “preventing falls”
Take home message

- Falls are common and costly but many are preventable
- Targeted exercise that provides a high challenge to balance is effective in preventing falls
- Balance-challenging exercise can be incorporated into everyday activities for older people
- Older people may need extra education and support to maintain participation
Come to Sydney, Australia!

Australian and New Zealand Falls Prevention Society conference
16-18 November 2014, Sydney
