

Artificial Intelligence & Machine Learning predicting pathology results and increasing training and internal controls.

Author (s) Name: Felipe Sueiro - VETPAT Veterinary Pathology and Molecular Biology, Brazil
Bruno Varela - Adapto Solutions, USA

The use of Big Data in pathology can provide valuable information on the ability to diagnose and predict the behavior of certain diseases. VETPAT and Adapto Solutions developed an AI & Machine Learning platform based on a database of more than 100,000 histopathological results in animal pathology to enhance even more the current controls on pathology analysis. PredicSense is able to predict diagnosis based on demographic data (gender, age, breed, location) and patient history. Thus, pathologists can predict outcomes in advance and correlate histological analysis with the most likely outcomes of that patient profile.

Input form

Sexo: Macho
Cidade: Lisboa

Idade: 10
Especie: Feline

Resultado: ✔

Indicador: ✔

Indicador: ✔

Diagnosis	Probability
carcinoma	88.06
hemangiosarcoma	0
melanoma	0

OK Cancel
